# SPECIFICATIONS

<b>CRT</b>	150 mm rectangular with internal graticule	
Acceleration Voltage	17 kV	
Display Area	8 × 10 div (1 div = 10 mm)	
<b>VERTICAL AXIS (CH1 and CH2)</b>		
Sensitivity	5 mV/div to 5 V/div ± 2% (10 °C to 35 °C) 1 mV/div to 2 V/div ± 4% (10 °C to 35 °C)	
Attenuator	12 steps, 1 mV/div to 5 V/div in 1-2-5 sequence Vernier control for fully adjustable sensitivity between steps	
Input Impedance	1 MΩ ± 1%, 20 pF ± 3 pF	
Frequency Response		
	5 mV/div to 5 V/div	DC; DC to 100 MHz, within -3 dB AC; 5 Hz to 100 MHz, within -3 dB
	1 mV/div, 2 mV/div	DC; DC to 20 MHz, within -3 dB AC; 5 Hz to 20 MHz, within -3 dB
Rise Time	3.5 ns or less (5 mV/div to 5 V/div)	17.5 ns or less (1 mV/div, 2 mV/div)
Signal Delay Time	More than 10 ns on the CRT screen	
Crosstalk	-40 dB or less (at 1 kHz)	
Operating Modes	CH1	CH1 single trace display, and dual to quad trace display in combination with other channel (s)
	CH2	CH2 single trace display, and dual to quad trace display in combination with other channel (s)
	CH3	CH3 single trace display, and dual to quad trace display in combination with other channel (s)
	CH4	CH4 single trace display, and dual to quad trace display in combination with other channel (s)
	ADD	CH1 + (±CH2) added display, and dual to quad trace display in combination with other channel (s)
	ALT	Dual to quad trace alternating
	CHOP	Dual to quad trace chopped
Channel Polarity	Normal or inverted, channel 2 only inverted	
Bandwidth Limiting	Approx. 20 MHz	
Chop Frequency	Approx. 500 kHz	
Delay Time Difference	CH1 to CH2 ; 0.5 ns or less CH1, CH2 to CH3, CH4 ; 1 ns or less	
Non-distorted Maximum Amplitude	More than 8 div (DC to 100 MHz)	
 Maximum Input Voltage	800 Vp-p or 400 V (DC + AC peak)	
<b>VERTICAL AXIS (CH3 and CH4)</b>		
Sensitivity	0.1 V/div, 0.5 V/div, ± 2% (10 °C to 35 °C)	
Input Impedance	1 MΩ ± 1%, 20 pF ± 3 pF	
Coupling Method	DC coupling	
Frequency Response	DC to 100 MHz, within -3 dB	
Rise Time	3.5 ns or less (at 150 MHz)	
 Maximum Input Voltage	800 Vp-p or 400 V (DC + AC peak)	
<b>HORIZONTAL AXIS (Input thru CH2)</b>		
Operating Modes	With HORIZ. MODE switch, X-Y operation is selectable CH1 to CH4 and ADD ; Y axis CH2 ; X axis	
Sensitivity	Same as vertical axis (CH2)	
Input Impedance	Same as vertical axis (CH2)	
Frequency Response	DC	DC to 2 MHz, within -3 dB
	AC	5 Hz to 2 MHz, within -3 dB
X-Y Phase Difference	3° or less at 100 kHz	
 Maximum Input Voltage	Same as vertical axis (CH2)	

# SPECIFICATIONS

<b>SWEEP</b>		
Type	A	A sweep
	A INT B	B sweep waveform is displayed as an intensified portion of the A sweep.
	ALT	A sweep (intensified for duration of B sweep) and B sweep (delayed sweep) alternating
	B	B sweep
	X-Y	X-Y oscilloscope
Sweep Time	A	20 ns/div to 0.5 s/div, $\pm 2\%$ (10 °C to 35 °C), in 23 ranges, in 1-2-5 sequence Vernier control provides fully adjustable sweep time all ranges.
	B	20 ns/div to 5 ms/div, $\pm 2\%$ (10 °C to 35 °C), in 20 ranges, in 1-2-5 sequence
Sweep Magnification		$\times 10$ (ten times) $\pm 5\%$ (A and B)
Linearity		20 ns/div to 0.5 s/div : $\pm 3\%$ ( $\pm 5\%$ , at $\times 10$ MAG)
Holdoff		Continuously variable for A sweep from NORM to more than five times
Trace Separation		B sweep can be separated from A sweep up to 4 divisions downward, continuously adjustable.
Delay Method		Continuous delay, Trigger delay and Trigger count
Delay Time		Continuous delay, Trigger delay ; 0.2 to 10 times of A SWEEP TIME/DIV set value (5,000 count fullscale)
Trigger Count		1 to 2,000 count, Max. usable frequency: 10 MHz
Delay Accuracy		$\pm (2\%$ of set value + $1\%$ of fullscale) + (0 to 100 ns)
Delay Jitter		1/20,000
<b>TRIGGERING</b>		
A Trigger Modes		AUTO, NORM, SINGLE, FIX
A Trigger Source	V. MODE	Triggered by input signal selected with VERTICAL MODE selector
	CH1	Triggered by CH1 vertical axis input signal
	CH2	Triggered by CH2 vertical axis input signal
	CH3	Triggered by CH3 vertical axis input signal
	CH4	Triggered by CH4 vertical axis input signal
	LINE	Triggered by line frequency
A Trigger Coupling		AC, NOISE <sub>REJ</sub> , HF <sub>REJ</sub> , DC, TV FRAME, (In TV COUNT mode, enables switching between FLD1/FLD2 and 525/625 lines.), TV LINE
A Trigger Level		$\pm 90^\circ$ adjustable
A Trigger Polarity		+/-
B Trigger Modes		Starts After Delay, B Triggerable After Delay and TRIG COUNT
B Trigger Source	CH1	Triggered by CH1 vertical axis input signal
	CH2	Triggered by CH2 vertical axis input signal
	CH3	Triggered by CH3 vertical axis input signal
	CH4	Triggered by CH4 vertical axis input signal
B Trigger Coupling		AC, NOISE <sub>REJ</sub> , HF <sub>REJ</sub> , DC, TV LINE
B Trigger Level		$\pm 90^\circ$ adjustable
B Trigger Polarity		+/-

# SPECIFICATIONS

Trigger Sensitivity	COUPLING	FREQUENCY RANGE	MINIMUM SYNC AMPLITUDE
	DC	DC to 50 MHz/DC to 100 MHz	1 div/1.5 div
	AC	20 Hz to 50 MHz/20 Hz to 100 MHz	1 div/1.5 div
	NOISE <sub>REJ</sub>	Two times of minimum sync amplitude.	
	HF <sub>REJ</sub>	Increased minimum sync amplitude for above 30 kHz.	
	TV FRAME	1 div (140 IRE)	
	TV LINE	1 div (140 IRE)	
		AUTO: Same as above specification for above 50 Hz	FIX: Same as above specification for above 40 Hz.
Jitter	0.5 ns or less at 100 MHz at 2 ns/div sweep rate ( $\times 10$ MAG on)		
<b>INTENSITY MODULATION</b>			
Sensitivity	+ 5 V, Negative voltage increases brightness, positive voltage decreases brightness		
Input Impedance	Approx. 10 k $\Omega$		
Usable Frequency Range	DC to 10 MHz		
Maximum Input Voltage	50 V (DC + AC peak)		
<b>VERTICAL AXIS OUTPUT (CH1 only)</b>			
Output voltage	Approx. 50 mVp-p/div (into 50 $\Omega$ load)		
Output Impedance	Approx. 50 $\Omega$		
Frequency Response	100 Hz to 100 MHz, within $-3$ dB (at into 50 $\Omega$ )		
<b>TRACE ROTATION</b>	Electrical, adjustable from front panel		
<b>CALIBRATION VOLTAGE</b>	1 V p-p $\pm 1\%$ , Positive square wave, 1 kHz $\pm 3\%$		
<b>READOUT</b>			
Calendar	Year/Month/Day/O'clock/Minute Clock accuracy; $\pm 2$ min./month Battery life: About 30,000 hours (at room temperature)		
Set Value	CH1—CH4 scale factor (with probe detection), GND, AC/DC, V-UNCAL, ADD, INVERT, BW, A and B sweep scale factor (magnification conversion), SWEEP VARIABLE UNCAL, X-Y (CH2-X), DELAY TIME, TRIG COUNT, TV COUNT		
Cursor Mode	$\Delta V1$	Voltage difference between $\Delta$ REF and $\Delta$ cursors on a CH1 scale factor basis	
	$\Delta V2$	Voltage difference between $\Delta$ REF and $\Delta$ cursors on a CH2 scale factor basis	
	$\Delta T$	Time difference between $\Delta$ REF and $\Delta$ cursors on the basis of sweep scale factor	
	$1/\Delta T$	Frequency between $\Delta$ REF and $\Delta$ cursors on the basis of sweep scale factor	
		RATIO: Voltage ratio and time ratio between $\Delta$ REF and $\Delta$ cursors, supposing 5-division on the CRT as 100%	
	PHASE: Phase difference between $\Delta$ REF and $\Delta$ cursors, supposing 5-division on the CRT as 360 $^\circ$		
Cursor Measurement	Resolution	10 bits	
	Measurement accuracy	$\pm 3\%$	
	Measurement range	Vertical direction: $\pm 3.6$ div or more from the CRT center Horizontal direction: $\pm 4.6$ div or more from the CRT center	

# SPECIFICATIONS

<b>PROGRAM MODE</b>			
Programming capacity		20 steps × 5 blocks	
Programmable parameters	CURSORS	CURSOR MODE	$\Delta V1, \Delta V2, \Delta T, 1/\Delta T, \text{TRACKING}$
		CURSOR	$\Delta \text{REF}, \Delta$
	VERTICAL	VERTICAL MODE	CH1, CH2, CH3, ADD, CHOP, ALT, CH2 INV, 20 MHz BWL
		ALT	CH1, CH2, CH3, CH4
		ACC, DC, GND	CH1, CH2

# SAFETY

## SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. The specified voltage is shown at the fuse holder of the AC inlet. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

### Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

### Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the oscilloscope at earth ground. Do not attempt to defeat the ground wire connection or float the oscilloscope; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

The optional power cords are shown as follows in Fig. 1.

### Line fuse

The fuse holder is located on the rear panel and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

### Voltage conversion

This oscilloscope may be operated from either a 100 V to 240 V, 50/60 Hz power source. Use the following procedure to change from 100 to 240 volt operation or vice versa.

1. Remove the fuse holder.
2. Replace fuse F 1 with a fuse of appropriate value, 1.2 amp for 100 VAC to 120 VAC operation, 0.8 amp for 220 VAC to 240 VAC operation.
3. Reinsert it for appropriate voltage range.
4. When performing the reinsertion of fuse holder for the voltage conversion, the appropriate power cord should be used. (See Fig. 1.)

Plug configuration	Power cord and plug type	Factory installed instrument fuse	Line cord plug fuse	Parts No. for power cord and plate
	North American 120 volt/60 Hz Rated 15 amp (12 amp max; NEC)	1.2 A, 250 V Fast blow 6 × 30 mm	None	Cord: E30-1820-05
	Universal Europe 220 volt/50 Hz Rated 16 amp	North Europe 0.8 A, 250 V Slow blow 5 × 20 mm  Other Europe 0.8 A, 250 V Fast blow 6 × 30 mm	None	Cord: E30-1819-05
	U.K. 240 volt/50 Hz Rated 13 amp	0.8 A, 250 V Fast blow 6 × 30 mm	0.8 A Type C	—
	Australian 240 volt/50 Hz Rated 10 amp	0.8 A, 250 V Fast blow 6 × 30 mm	None	Cord: E30-1821-05
	North American 240 volt/60 Hz Rated 15 amp (12 amp max; NEC)	0.8 A, 250 V Fast blow 6 × 30 mm	None	—
	Switzerland 240 volt/50 Hz Rated 10 amp	0.8 A, 250 V Fast blow 6 × 30 mm	None	—

Fig. 1 Power Input Voltage Configuration

# CIRCUIT DESCRIPTION

## Vertical Attenuator Circuit (X75-1180-01)

The attenuators for channel 1 and channel 2 are operated by the signals from the panel, and AC/DC/GND input coupling and attenuation of 1/1, 1/10, and 1/100 are switched.

The vertical input signal from the BNC input terminal passes through the attenuator and is input to the buffer amp formed by U101 and Q101 (CH2: U201 and Q201). U101 is a source follower and constant current supply and Q101 is for input protection. The input signal is impedance converted by these components and is input to the 1st amp formed by U102 and Q102 (CH2: U202, Q202). A differential signal is created here, and the 1st amp for channel 2 contains an INV circuit that switches the inversion transistor ON/OFF using the data from the R/O unit.

U1 and U2 produce a voltage signal from the serial data from the R/O unit, and this serial data is converted to a 0/5 V parallel signal. Although inversion is not possible on the channel 1 side, the same circuit as the channel 2 circuit is used for circuit stability, and the bias of the inversion transistor is fixed at the off state. The channels 1 and 2 input signals are input to the vertical preamp unit after passing through the 1st amp.

The channels 3 and 4 input signals are input to the 1/1 or 1/5 attenuator as selected by the K301 (CH4 : K401) relay. The signal is then input to the buffer amp formed by Q301 and 302 (CH4: Q401, 402). Q301 is a source follower, Q302 is a constant current supply, and Q303 is for input protection. The signal is impedance converted by this amp. The signal is then input to the 1st amp formed by Q304 and 305 (CH4: Q404, 405). This amplifier produces a differential signal. The channel 3 and channel 4 signals are input to the vertical preamp unit after passing through the 1st amp.

## Switch Unit (X69-1150-02)

### \* Switch Matrix

All the tact switches on the panel form a switch matrix. Pins 1, 2, 3, 4, and 15 of U9 are all low when a tact switch is not pressed, and the output (D0 to D7) is at +5 V.

When a switch is pressed, the output of the switch (one of D0 through D7) goes to low due to Pin 15, 1, 2, 3, or 4 of U9 going to low. The output from D0 through D7 is connected to the R/O unit, and when any of these outputs goes to low, an interrupt is applied to the CPU and serial data is sent to U9. U9 which receives data from the R/O unit, first switches all of Pins 15, 1, 2, 3, and 4 to high and then switches each pin to low. The resulting voltage from

the output (D0 to D7) is used to determine which switch was pressed.

### \* Panel LED

The corresponding LEDs on the panel are illuminated when Pins 15 and 1 through 7 of U2 through U8 go from high to low. Serial data from the R/O unit is sent to U2 through U8, and the LED to be illuminated is selected according to that signal.

### \* Rotary Encoder

Rotary encoders are used for the VOLTS/DIV and SWEEP TIME controls for channel 1 and channel 2. The data from these encoders is received by the R/O unit. Refer to the section on the R/O unit regarding operation.

## Panel Unit (X66-1050-01)

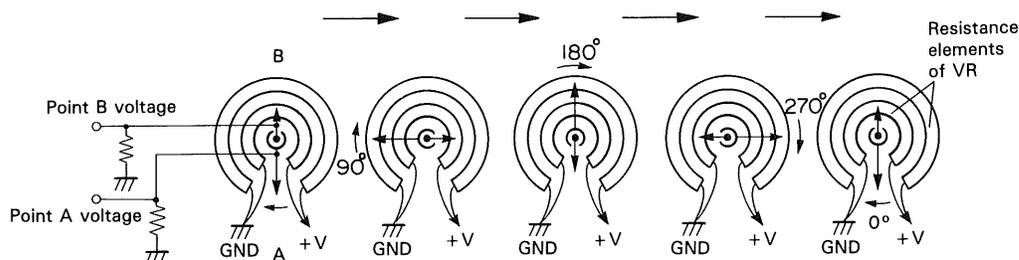

### \* VR (VR1 to 10), Uncal Search

Variable resistors (VR) are used for setting the position, V-variable, trig level, hold off, and T-sep for each channel. Both terminals of each of the VRs are connected to +/− 10 V, +10 V and GND, or +5 V and GND, and the set voltage is sent to the various units.

The collector of Q1, 2 (CH1) or Q3, 4 (CH2) goes from 0 V to approximately +5 V when V-VARIABLE is set to the UNCAL state, voltage is supplied to the R/O unit, and the UNCAL mark (●) appears on the screen.

### \* Comparator, Endless VR

Endless VRs are used in four locations: horizontal position, Δ, and Δ REF. As shown in Fig. 1, two resistance elements are used alternately for this operation. The output voltage is received by the R/O unit. U1a supplies stable voltage to each terminal of the endless VRs.

# CIRCUIT DESCRIPTION

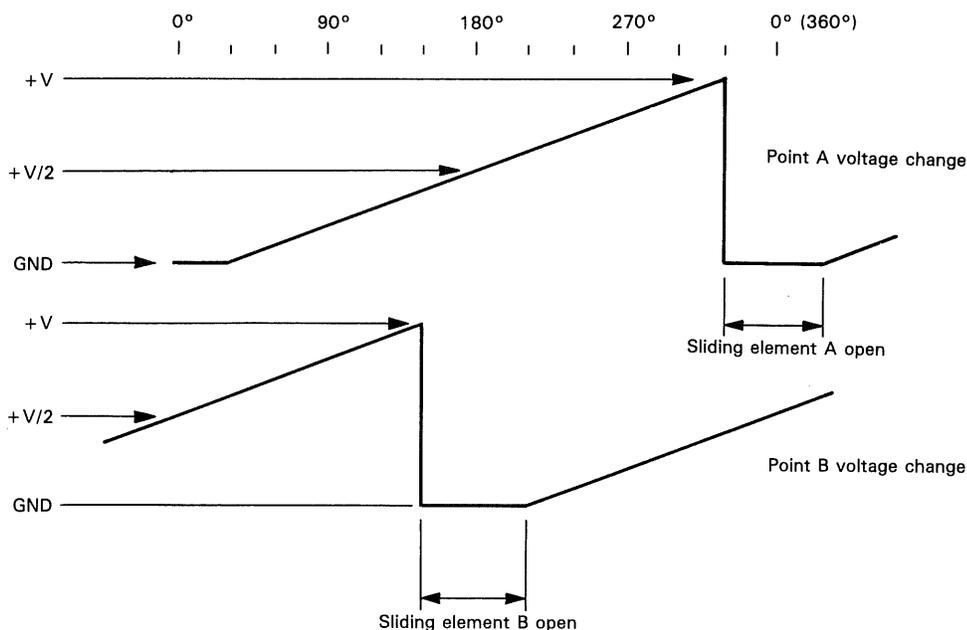

Fig. 1 Endless VR Operation

## High Voltage Unit (X68-1510-03)

### \* Blanking Circuit

This is a circuit for amplifying the blanking signal from the horizontal unit. The signal input from P19 passes through the Q8 emitter follower, and is input to Q6 for amplification. Q5 is a constant current supply for Q6 and Q7 is a transistor for absorbing current. Negative feedback is applied to this by R26, and the degree of amplification is determined by R26 and R358 of the horizontal unit. The blanking signal amplified to high voltage is then applied to G1 of the CRT from the high voltage oscillation circuit (described below) using D8 through D10. The G1 potential from K (cathode) is set a low level, and the brightness decreases as this level decreases.

The voltage of the blanking signal of the horizontal unit is altered according to the INT VR of the VR unit, altering the brightness which results.

The output from Q6, ie., the amplified blanking signal, is input to Q4. The brightness is altered by the auto-focus so that the focus point is not lost.

Q3 is a constant current supply for Q4. The signal is then overlapped with the high voltage level using D4 through 7, in the same manner, and the resulting signal is applied to the P1 terminal of the CRT after the potential is controlled by VR23 of the VR unit.

### \* High Voltage Oscillation Circuit

Oscillation at 30 kHz is invoked by Q1, and becomes high voltage by the high voltage block. U1 and Q2 provide negative feedback for control.

## Power Supply Unit (X68-1500-01)

The power supply circuits are composed of six regulated output systems (+5, +/− 10, +15, +60, and +140 V) and two unregulated systems (+/− 13 V).

The regulated outputs are all with reference to −10 V. This −10 V output uses a 5 V Zener diode (D5) as reference, and is obtained by the drive transistor (Q6) and op amp U3. Other regulated output is obtained using op amps (U1, 2, and 3) and transistors (Q1, 3, 5, 6, 7, and 8), with this −10 V output as reference.

The unregulated output of +/− 13 V uses the voltage before regulation to obtain regulated output of +/− 10 V.

## VR Unit (X81-2330-03)

### \* Calibration Voltage Generation Circuit

Op amp U1 is used as an oscillator, and the DC voltage is switched using D1 to generate a 1kHz square wave.

### \* Scale Illumination Circuit

This circuit drives an illumination lamp with the Q6 emitter follower as an output stage. D4 and 5 are used for switching to provide one-shot illumination.

### \* Trace Rotation Circuit

This circuit drives a coil for rotation by the Q2 and 3 emitter followers.

### \* Intensity Circuit

This circuit has three 20kΩ VRs, A SWEEP, B SWEEP, and R/O, both ends are connected to +/− 10 V, and the set voltage is sent to the horizontal unit to create a blanking signal. The R/O VR is equipped with an ON/OFF switch.

# CIRCUIT DESCRIPTION

## Final Unit (X80-1100-03)

### \* Vertical Amplification System — Vertical Final Preamp to Vertical R/O Switching to Vertical Final Amp

The signal output from the vertical preamp unit and which passed through the delay line, is input to the vertical amplification system of the final unit. The signal first passes through the Q1 and Q2 emitter followers, and is input to Q3 and Q4 for amplification. Q203 and 204 alternately select Q3 and Q4 that amplify the waveform for output of characters on the CRT screen by the R/O function and Q201 and Q202 which amplify the character information sent from the R/O unit. When the ROREQ signal from the R/O unit is high, Q204 is switched ON, Q3 and 4 are switched ON, Q203 is switched OFF, and Q201 and 202 are switched OFF. The signal is amplified and the character information is not input. When the ROREQ signal is low, the opposite occurs, and the character information is amplified without signal input. The signal then enters the Q5 and 6 base grounded amp, is impedance converted by the Q7 and 8 emitter follower, is input to the final amp formed by Q9, 10, 13, 11, 12, and 14, and is input to the deflection plate of the CRT.

### \* Horizontal Amplification System — Horizontal Final Preamp to Horizontal R/O Switching to Horizontal Final Amp

The signal sent from the horizontal unit is input to the Q101, 102 base grounded amp, and is amplified by Q103, 104 after passing through D101, 102, 105 and 106 for excessive input limiting. In the same manner as the vertical system, Q208, 209 switches between the amp for signal formed by Q103, 104 and the amp for characters formed by Q206, 207.

Following this, the signal is input to the Q105, 106 base grounded amp, is impedance converted by the Q107, 108 emitter follower, is amplified by Q109, 110, is impedance converted by the Q112, 113 emitter follower, and is input to the Q114, 115 amp. Q116, 117 form a constant current supply to supply a fixed current level to Q114, 115. Negative feedback is applied to the output by R114, 145, 153, and 154, and the degree of amplification is determined by R144, 145, 153, 154 and R152, 133. This configuration provides stability and allows for amplification with high amplitude.

## Vertical Preamp Unit (X73-1760-01)

The channel 1 and channel 2 signal output from the ATT unit enter the vertical preamp unit and are first input to the buffer amp formed by Q101 (CH2: Q201). The signals are then input to the X5 and X1 amps. The X5 amp is formed by Q102 (CH2: Q202) and the X1 amp by Q103 and 104 (CH2: Q203, 204). Switching between the amps is by Q105 and 106. When Q105 is ON, Q106 is OFF and the X5 amp is selected. When Q106 is ON, Q105 is OFF and the X1 amp is selected. The signal which passed through Q108, 109 (CH2: Q208, 209) cascade connected to Q102, 103, 104 (CH2: Q202, 203, 204) is input to the 1/1, 1/2, or 1/4 ATT, switched by the K101 (CH2: K201) relay. The signal emerging from the ATT is impedance converted by Q112, 113 (CH2: Q21, 213), and input to Q114, 115 (CH2: Q214, 215). There is a vertical variable circuit formed by R169,

170, U102 (CH2: R269, 270, U201) between the cascade connections. This circuit applies the DC signal for variable control sent from the panel by U101 (CH2: U201) connections. This circuit applies the DC signal for variable control, sent from the panel by U101 (CH2: U201) and varies the gain by varying the impedance of HIC U102 (CH2: U202). The CH1 and CH2 signals emerging from the cascade amp that forms the 3rd amp are impedance converted by the buffer amp formed by Q119, 120 (CH2: 219, 220), and input to the amp for trig signal output (formed by Q601 to 604), Q528 and 529 cascade connected to Q501 and 502. Between the cascode amps, there is an amp for POSI variation by Q503, Q504 (CH2: Q507, 508) and a CH selection circuit formed by Q1 and 2 (CH2: Q3, 4). Although the trigger signal output amp is a balanced circuit using Q601 and 602 (CH2: 605, 606), only Q601 (CH2: Q605) actually extracts the trigger signal, and this component is cascode connected to Q603 (CH2: Q607). Subsequent explanation on this trigger amp will be given below.

### \* CH3 and 4 3rd Amp to Select SW

Q301 and 302 (CH4: Q401, 402) are cascode connected to Q304 and 305 (CH4: 404, 405) of the attenuator unit, and there are resistors and capacitors for gain control and frequency response correction between them. The signal emerging from the cascode amp enters the buffer amp formed by Q304, 305 (CH4: Q404, 405), is impedance converted, and input to the 1st trig amp.

The input to the trig amp is approximately 50% of the output from the 3rd amp, and a balance circuit is formed by Q609 and 610 (CH4: Q613, 614) for balancing. However, the signal extracted as the trigger signal is actually only the signal from the Q609 side (CH4: Q613). Subsequent explanation on this trigger amp will be given below.

The signal output from the 3rd amp will be input to the trig amp and V. mode select switch. This is formed by Q509, 510 (CH4: Q513, 514) and Q5, 6 (CH4: Q7, 8). When the V. mode is selected, Q5, 6 (CH4: Q7, 8) are OFF, and the signal passes through D505, 506 (CH4: D507, 508), and is input to the mix amp. When this mode is not selected, Q5, 6 (CH4: Q7, 8) are ON, and the signal is canceled. This operation is the same for channels 1 and 2. Q511, 512 (CH4: Q515, 516) between Q509, 510 (CH4: Q513, 514) and Q5, 6 (CH4: Q7, 8) form a POSI variable amp that changes the bias of Q512 (CH4: Q516) to vary the position, according to the DC voltage from the panel.

### \* Mix Amp to 4-ch Amp to T. SEP Amp to 20 MHz BW SW

The signals that passed through the select switches for the various channels and diodes D501 through 508, are input to the mix amp formed by Q528, 529. Q518 is ON when ADD is selected in the V. mode. The impedance of the signal is then converted by the buffer amp formed by Q519, 520, and input to the T. SEP amp formed by Q522 and 523. In this T. SEP amp, the B SWEEP position is altered by input of a control signal to the base of Q523 for switching so that the amp only operates by the B sweep signal.

The impedance of the signal which passed through the T. SEP amp is converted by the buffer amp formed by Q524, 525, and the signal is input to the delay line. A switch for performing 20 MHz BW is formed by Q526, 527, a low-pass

# CIRCUIT DESCRIPTION

filter is formed by C509, 510, and the circuit functions as a 20 MHz BW. The signal then passes through a delay line and is input to the final unit.

## \* 1st Trig Amp — Trig Select — 2nd Trig Amp

The trigger signal extracted by Q601 and 602 (CH1), Q605 and 606 (CH2), Q609 and 610 (CH3), and Q613 and 614 (CH4) is input to the amps formed by Q603 and 604 (CH1), Q607 and 608 (CH2), Q611 and 612 (CH3), and Q615 and 616 (CH4). It is then input to trig select after impedance conversion. At this time, a portion of the channel 1 signal is split to the CH1 out amp formed by Q621 and 622, and a portion of the channel 2 passes through Q620 and becomes the X signal for the X-Y mode.

Trig select is a switch formed by D601, 602, 603, and Q623 to 621. When the various transistors are switched on by the CH select logic signal, the diode connected to the transistor has reverse polarity and goes off. The diode can be switched on by switching the transistor off, and the trigger signal will be output to the amp in the next stage. D601 receives the A trig, D602 receives the B trig, and D603 receives the line trig.

The trigger signal received by trig select is impedance converted by the 2nd trig amp formed by Q617 and 632 (A trig) and Q618 and 633 (B trig), and is then sent to the horizontal unit.

## \* Control of vertical preamp unit

The following signals are sent from the R/O unit for control of the vertical preamp unit.

- (1) Serial data .... this signal is sent from the R/O unit together with the clock signal, and input to U1, U2, U3, U4, U5, U6, U7, and U8 for conversion to parallel data.

The following are controlled by this signal:

- X1 and X5 amp switching
- 1/1, 1/2, 1/4 ATT switching
- V-MODE switching
- 20 MHz BW limit
- Trigger signal selection

- (2) Voltage supplied directly from panel .... voltage between 0 V and 10 V is created by the variable resistors on the panel, and is input as a signal to the vertical preamp unit through the R/O unit.

- POSI variation
- V-VAR

The above are the signals externally input for control.

## Horizontal Unit (X74-1480-03)

The trigger signals (ATR, BTR signal) supplied from the vertical preamp unit (X73-1760-01) are input to the trig preamps. The A trig preamp is formed from Q1 and Q2, etc., and the B trig preamp is formed from Q14 and Q15, etc. When a TV signal is input, TV coupling is selected to amplify the TV sync signal. The control signal to perform this is output from U29, and the gain of Q1 and Q14 is changed by switching with Q9 to correspond to the TV sync signal. The trigger level is altered after the signal passes through the trig preamp. The trigger level of A-sweep is altered by U21 and the level of B-sweep by U22. The level is switched by the U16 analog switch by panel switch operation, and the FIX signal, TV signal, and A BLVL signal are selected.

The input signal with trigger level altered is input to the trig amp formed by Q5, Q6, Q7 and Q17, Q18, and Q19. When coupling is set to HFR<sub>EB</sub> by operation of the panel switch, a control signal is output from U29, Q8 or Q20 is switched on, and the high frequency components are attenuated. The signal is input to the Schmitt circuit formed by U1 or U2 after passing through the trig amp. The hysteresis width of the Schmitt circuit is altered by the noise rejection control signal output from U29, allowing stable triggering even for input signals containing noise. The control signal output from U30 determines whether the slope is positive or negative. The signal output from the A-sweep Schmitt circuit is input to the auto freerun circuit formed by Q103 and Q104 to control U39 according to the auto or normal mode. This sets the unit to the sweep mode or trigger standby mode. The AS signal output from Q of U3a is input to Q109 of the A-sweep circuit, performing start and stop control of the A-sweep. U24b in the A-sweep circuit takes the analog voltage supplied from U101 unit and amplifies it to 5 V at range 1, 2.5 V at range 2, and 1 V at range 5. The current is determined by this voltage and the aggregate resistance selected by the U17 analog switch. This determines the sweep time.

The AS signal output from Q of U3a and the BS signal output from Q of U3b are input to the blanking circuit formed by U4, the UNBL signal is generated from ROUBL, ROINT, BINT, AINT, etc., and supplied to the high voltage unit (X68-1500-01).

In the same manner as the A-sweep circuit, U26d in the B-sweep circuit amplifies the analog voltage fed from the R/O unit, and determines the current by the U18 analog switch to determine the sweep time.

The A-sweep signal output from Q116 and the B-sweep signal output from Q134 are input to the mix amp formed by U19, Q302, Q303, Q304, Q306, and Q307. In this circuit, the analog voltage supplied from X10 MAG and the R/O unit are amplified by U27, and H-POSI control is performed. The signals output from this circuit are fed to the final unit (X80-1100-01) as the X+ and X- signals.

Switching between A-sweep and B-sweep is controlled by U7, and this signal is sent to the mix amp and blanking circuit. The switching signal for chopping of A-sweep and B-sweep is generated by the circuit formed by Q403 and Q404. The chop frequency at this time is 500 kHz.

Delayed sweep is performed by comparing the voltage of the A-sweep output from Q116 and the DTP signal supplied from the R/O unit by the delay comparator formed by Q102, U25, etc, and the position to start the B-sweep is determined. The signal to start the B-sweep at this time is input to the logic circuit for B-sweep formed by U13a, b, c, and U6, and the signal to output the BS signal is sent to U3b. In the single sweep mode, the SGL signal supplied from the R/O unit is input to the A-sweep logic circuit formed by U11b, U12d, and U5, and the A-sweep trigger standby mode is selected when the RESET signal is input.

There is also a 1-shot ILLM circuit which illuminates a lamp for approximately 1 second when the single sweep is completed. This circuit is formed from U12, Q405, Q406, C405, and C406, etc.

# CIRCUIT DESCRIPTION

## Readout unit (X77-1490-01)

The R/O unit contains an 8-bit Z-80A CPU, and has two major functions: control of the operation of the various sections and the output of CRT character information.

The basic clock which forms the basis for the timing of all IC operations is generated by the 10 MHz oscillator formed by U11d and X1. The 10 MHz CLK is used for operation of U33 (R/O controller), and this clock signal is divided to 1/4 by U10 to create the 2.5 MHz CLK. This clock signal is used for operation of the U5 CPU (Z-80A) and as a control signal for sending data and addresses to U33.

Changes in information from the switch unit (X69-1150-02) and the timing, clock, and soft timers for the CRT display are all realized through interrupts which are sent to the CPU. Changes at the switch unit include interrupts issued when a pushbutton switch is pressed and when the rotary encoders used for VOLTS/DIV and SWEEP/DIV are rotated. When a switch is pressed, one of lines D0 through D7 of U24 connected as a data bus for switch information goes to "L", U14e goes to "L" causing Q of U21a to also go to "L", notifying the CPU that a switch position has been changed. When CRT information is changed by operation of the switches or variable resistors on the panel, the timing for updating the CRT indication is output every 13.5  $\mu$ s from U33. The change is latched to U21a, and indicated to the CPU as an interrupt. The CPU recognizes this interrupt and performs processing to update the CRT indication.

U12, U13, U17, and U18 form the import section which outputs the data decoded by U6 and U8 to the data bus. U12 is an import IC for evaluating the probe detection (1/1 to 1/10), battery capacity, and status of the CH1 and CH2 variables. Probe detection and variable status is fetched by the CPU approximately every 15  $\mu$ s, and evaluated and processing performed. The B1 battery capacity is monitored by U46a, and when the level drops below approximately 2.4 V, the status (H level) is fetched from the import at POWER ON, and "BATT DOWN" is displayed on the CRT screen.

U13 is an import IC for interrupt evaluation, and it determines whether an interrupt such as rotary encoder (CH1, CH2, SWEEP), 2 ms, clock, switch, or CRT indication has been transmitted to the CPU.

U17 receives the A-phase and B-phase status of the rotary encoder, receives and evaluates the movement of the endless VR, and receives and evaluates the single ready state. Reception and evaluation of the endless VR movement is made by having U35 compare the endless VR voltage and D/A converter (U37) voltage, to determine whether the endless VR has been rotated. U18 is an IC for fetching data from the panel switches, and it receives the state when a switch is pressed.

U6 through U9 are a decoder circuit, and U6 uses PAL. The PAL has a circuit configuration capable of decoding the import and output clocks, ROM, and RAM. U7 through U9 decode individual information selected by U9.

U8 outputs the decoded information from import U12, 13, 17, and 18, and the latch CLK (VLC, HLC, ALC, and LLC) for serial transfer.

U19 outputs the latch CLK (SLC) for serial transfer and the shift CLK (ASC, LSC, SSC, HSC, VSC).

U7 outputs the data latch CLK for serial transfers, the in-

terrupt latches (U20, U21, U22, and U23), and the RESET pulse. The data latch CLK is also used as the CLK for latching the data for serial transfers by U16.

A blanking signal is applied during serial transfer to prevent the effects of noise on the waveform. This blanking is output from Pin 21 of U33.

U1 is RAM, and 8 K  $\times$  8 bit memory is used. This SRAM is backed up by B1 when the power is off, and the power is switched by U19 when the power is turned on/off. Switching is performed by the U4 power reset IC, and a reset signal is supplied to U3, U5, and U19 at 4.4V  $\pm$  0.2 V. U2 is a software ROM, and both 16 K and 32 K can be used by switching by R128 and R256.

Although CTM5020 (U33) can be directly connected to 8080-type CPUs, direct connection of address and data is not possible with the Z-80 due to the absence of an ALE terminal. For this reason an ALE signal is generated by the ADD/DATA SELE circuit formed by U27, U28, U23b, U14b and d, U25b, and U29c to allow connection with U33.

The software timer needed for CPU operation is created by U26 as a 2 ms timer. This is latched to U20a every 2 ms to indicate an interrupt to the CPU.

U3 is backed up by lithium battery B1 when the power is off, and the 32.768 kHz basic clock from the crystal oscillator operates. An interrupt signal is output from U3 once every minute, and is latched to U20b. The calendar indication on the CRT is advanced one minute by the input of this interrupt.

The U37 D/A converter creates the voltage output for endless VR comparison, the analog control voltage used by the horizontal unit (X74-1480-03), and the cursor control voltage. The latter control voltage is switched by the U41 analog switch, and is output once every 4 ms by time division. This output control is performed by AX0 through AX3 of U33, and AX3 is a control terminal to prevent the comparison voltage being output to the control voltage when this voltage for endless VR comparison is output from the U37 D/A converter.

The cursor control voltage ( $\Delta$  and  $\Delta$  REF) output from U41 is switched with R/O-Y and R/O-X by the U40 and 43 analog switches, and output to the final amp.

There are analog control voltages used by the horizontal unit: B-vari, DTP, and H-posi.

B-vari output the reference voltages for sweep B, and the voltage determined by the 1-2-5 range is output (during CAL). During UNCAL, the B-vari voltage changes and the sweep time changes. At this time, the voltage is changed so that the amount of variation changes at the various ranges so that variation rate corresponds to the rotational speed of the endless VR. The count distribution is 2000 for range 1, 1000 for range 2, and 400 for range 5, and the amount of change per step is altered every 10, 6, and 2 counts respectively. B-vari passes through the U47a buffer amp before it is fed to the horizontal unit (X74-1480-03). The following is a description of the operation of the rotary encoder used for switching volts/div and sweep time. The rotary encoder has two outputs, and rotation to the right or left is determined by the output resulting from the phase difference.

# CIRCUIT DESCRIPTION

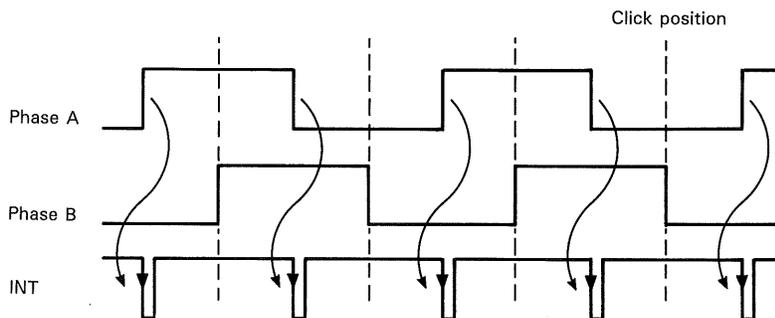

Fig. 2

Figure 2 shows the output waveforms of the rotary encoder, and phases A and B have the output waveforms indicated. In the case of the CH1 VOLTS/DIV rotary encoder, for example, the outputs from phases A and B are input to U29b and U31c respectively. U29 and U31 form a Schmitt circuit, eliminating chattering occurring when the rotary encoder is rotated, and shaping the waveforms to resemble those shown in the above diagram. (This is performed to prevent spurious operation.)

The signal with the waveform shaped is input to U30c, output as the INT signal shown in Figure 2. Q of U22a goes to "L" at the point indicated by the arrow and an interrupt signal is sent to the CPU. When the CPU enters the interrupt state, it immediately evaluates the status of phases A and B, determines the rotation to the right or left by the status of the change, and performs the appropriate processing. (The figure shows rotation to the right.)

U31a and U31b form the Schmitt for the CH2 VOLTS/div rotary encoder, U30d receives the signal after waveform shaping, and U23a receives the INT signal. U31d and U30a form the Schmitt for the CH2 Sweep Time/div rotary encoder, U30b receives the signal after waveform shaping, U22b receives the INT signal.

The DTP adds two analog voltages and is a 5000 count FS. These analog voltages are V-Delay and C-Delay. V-Delay is counted up to 4000 counts with C-Delay as 0 V, and is added by U45b. Following this, V-Delay and C-Delay are decreased one count each until 5000 counts are reached. This is equivalent to doubling the D/A resolution. The added DTP voltage passes through the U46b buffer amp, and is fed to the horizontal unit (X74-1480-03).

The voltage from the endless VRs used for cursor, H-POS1 is received by the U34 analog switch, and the control signal for selecting the endless VR is selected by VX0 to VX2 of U33. The output of the endless VR selected by U34 is input to U35, and compared with the voltage output from D/A convertor U37 by U35. As the U37 D/A convertor is a 12-bit unit and 8 bits are output to the D/A (U33 DA0 to DA7), the upper 4 bits are latched by U36 and the remaining 8 bits are then output. The discrete circuit formed by Q1, Q2, etc., and connected to Pin 17 of U37 is a DC-DC converter circuit used to supply -11 V to the D/A convertor.

The H-POS1 voltage is supplied to the horizontal unit through the hold circuit.

A random can method (X-Y display) is used for character display, and the U32 character generator is controlled by the character counter of the U33 R/O controller and the dot counter.

One cycle for readout indication is divided into four, and consists of lower characters, upper characters,  $\Delta$  REF cursor, and  $\Delta$  cursor.

Character data having a basic configuration of  $5 \times 7$  dots is input to the U32 character generator. The 3 bits from DO0 to DO2 are X-axis data, the four bits DO3 to DO6 are the Y-axis data, and DO7 is the character start/end control signal. The digital signal output from U32 is converted to the analog voltages by the U42 D/A convertor for the X-axis signal and the D/A convertor for the Y-axis signal formed by U39 and R58. These signals pass through analog switches U40 and U43, the U44 buffer amp, and are supplied to the final unit (X80-1100-03) as the R/O-X and R/O-Y character signals.

Character dot display on the CRT is controlled by the ROUB, ROB, and ROQ signals output from Pins 86, 87, and 88 of U33.

The ROB signal erases the real waveform display, the real waveform and readout are switched by the ROQ signal, and dot indication on the readout is performed by the ROUB signal.

# CIRCUIT DESCRIPTION

## TV Counter Unit (X76-1400-00)

The TV signal is input through pin 7 of P35, and the polarity is selected by U1a. When the base of Q4 is "L", Q2 goes ON and U1a becomes an inverted amplifier. The signal output from pin 1 of U1a passes through buffer amp U1b, clamps the sync signal at D1, and enters video amp U2. Then, the signal output from pin 7 of U2 is subjected to peak detection at D6 in order to maintain the amplitude of the output from pin 7 of U2 constant by controlling Q1. Q3 is the circuit which goes ON in other modes than the TV COUNT mode to cut the TV signal. The signal output from pin 7 of U2 is input to sync separator circuit U3. U4a is the circuit for extracting the equivalent pulse of horizontal sync signal. The pulse is supplied through gate U7 and used as the clock pulse of the TV counter circuit.

U5b detects the TV signal input and controls the auto-freerun circuit. U5a is the detector circuit of the interlaced, progressive signal.

U4b is the circuit which generates equivalent vertical sync signal when the progressive signal is input.

The output signal from U6a is differentiated by U7, sent through U6b, and output from pin 4 of P35 as the TV counter load pulse.

U8 is the shift register which loads and latches the serial data from the R/O.

U8 pin No.

- 1: "H" in TV counter mode, otherwise "L".
- 2: "L" in TV counter mode, otherwise "H".
- 3: "H" when A sweep time is between 0.2 ms/div and 20 ns/div in TV counter mode, otherwise "L".
- 15: "L" when TV is +SLOPE, "H" with -SLOPE.

U10 is the circuit which eliminates a flicker of waveform in TV counter mode, and which also controls U33 (X77-1490-01).

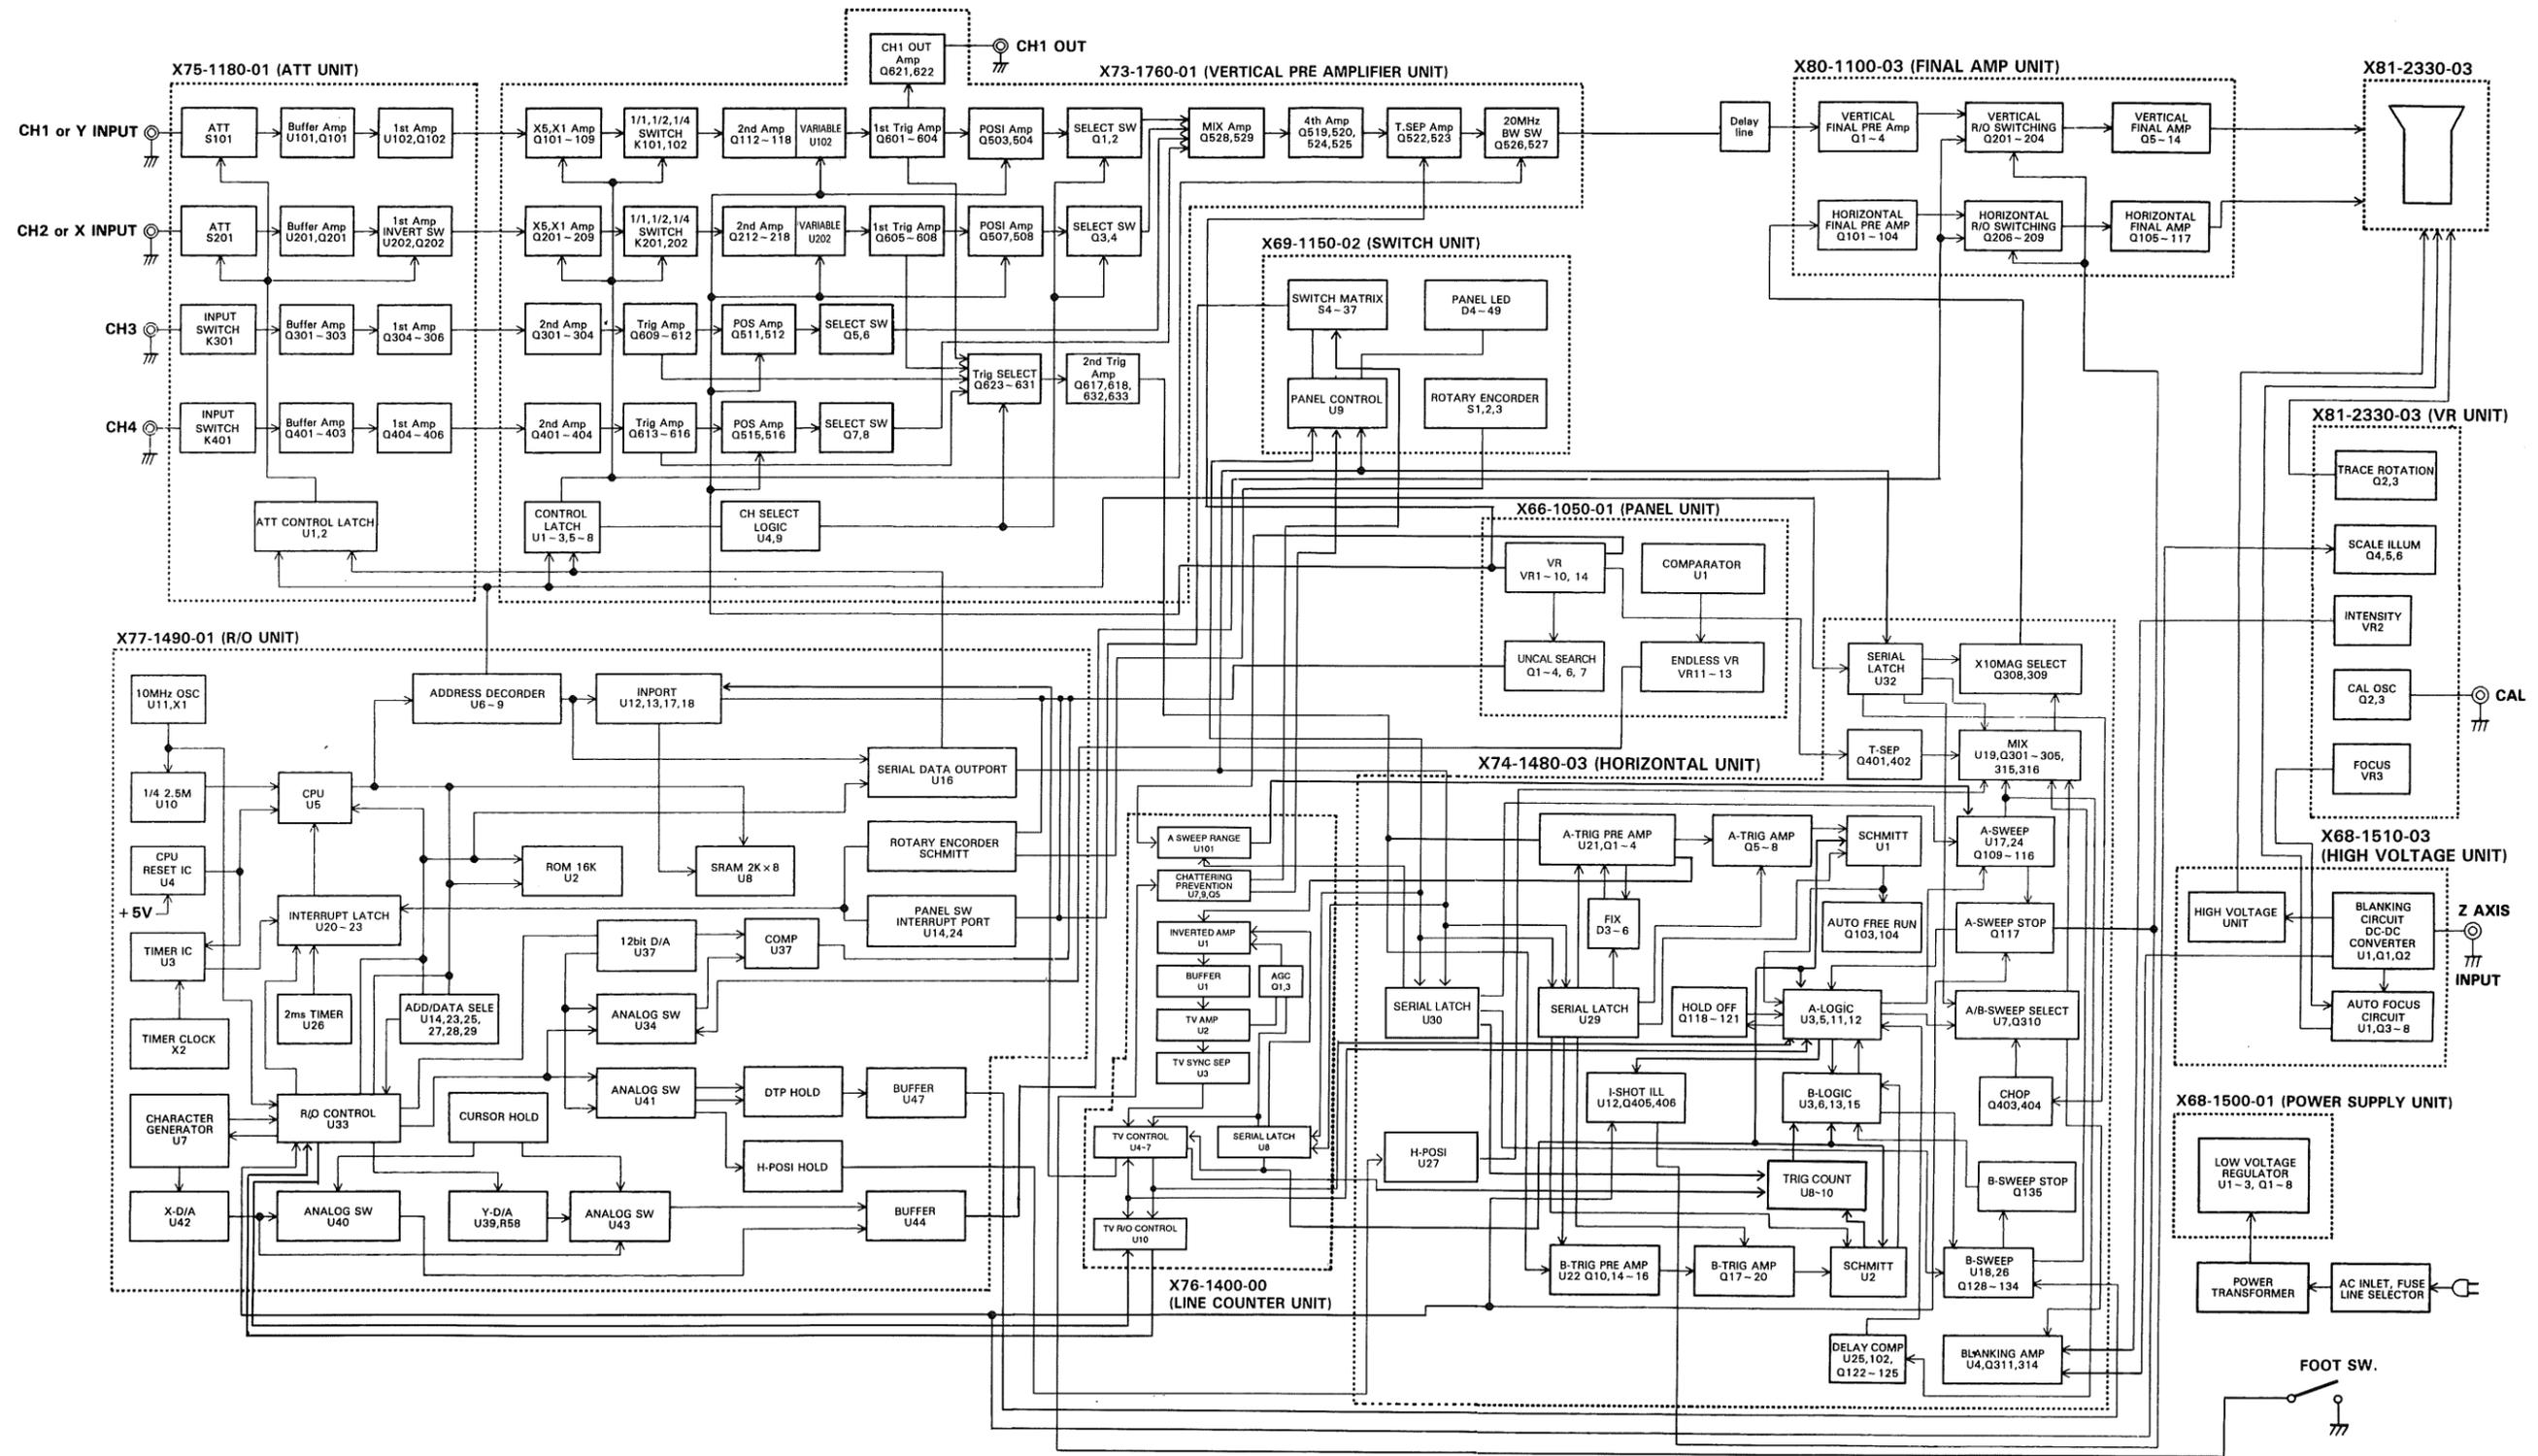

### \* Chattering prevention circuit

The signal input to pin 1 of P36 as the program count-up signal is sent through the protector circuit of D7 and D8, and input to pin 1 of U9. When the signal is input to U9, its pin 4 outputs pulse for the specified period of time, during which chattering can be prevented.

The output signal passes through D10, Q5 and U7, and controls D1 of the panel unit (X66-1050-01) and pin 5 of U9 to increment the count of the program.

D9 is the diode used to maintain the output "H" while the input signal level is "L" regardless of the time constant of U9.

# BLOCK DIAGRAM

# ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.

The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available, contact your dealer. For optimum adjustment, turn the power on and warm up the scope sufficiently (more than 30 minutes) before starting.

Before calibrating the scope, check the power supply voltage.

## TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustment.

Test Equipment	Model	Minimum Specification
Digital Multi-Meter	DL-706 (KENWOOD)	Impedance: More than 10 MΩ, Measuring range: 0.01 V to 199 V
Sine-Wave Generator	651 B (YHP)	Frequency: 10 Hz to 10 MHz, constant voltage over tuning range
Sine-Wave Generator	SG-503 (Tektronix)	Frequency: 50 kHz to 100 MHz, Output impedance: 50 Ω, constant voltage over tuning range
Square-Wave Generator	PG-506 (Tektronix)	Output signal: 1 kHz, Amplitude: 10 mVp-p to 10 Vp-p, Accuracy: within ± 1%, Rise time: 35ns or less 100 kHz, Rise time: 1 ns or less
Q Meter	4343B (YHP)	—
Color Pattern Generator	CG-911A (KENWOOD)	—
Oscilloscope	475A (Tektronix)	Sensitivity: more than 5 mV Frequency response: More than 250 MHz
Time-Marker Generator	TG-501 (Tektronix)	Time mark: 0.5 s to 0.1μs repetitive waveform
High-Voltage Probe	—	Input Impedance: 1000 MΩ
Termination	—	Impedance: 50 Ω Accuracy: within 3%
Termination	—	3 watts type impedance: 50 Ω
Attenuator	—	− 20 dB attenuation (50 Ω)

Table 1

## PREPARATION FOR ADJUSTMENT

### Control Settings

The control settings listed below must be used for each adjustment procedure.

Exceptions to these settings will be noted as they occur. After completing a adjustment, return the controls to the following settings.

NAME OF KNOBS	POSITION
INTEN	12 o'clock, A INTEN
READOUT INTEN	Fully counterwise
FOCUS, ASTIG	Optimum position
CH1, CH2, CH3, CH4 $\blacktriangleleft$ POSITION	Mechanical center
$\blacktriangleright$ POSITION/ $\times$ 10MAG	Mechanical center/OFF
VARIABLE, H.VARIABLE (VOLTS/DIV, SWEEP TIME/DIV)	CAL
AC-GND-DC (CH1 and CH2)	DC (GND: ON)
VERTICAL MODE	CH1
A.TRIGGERING COUPLING	AC
A.TRIGGERING SOURCE	VERT and CH1
TRIGGERING LEVEL	Mechanical center
TRIGGERING MODE	AUTO
VOLTS/DIV (CH1 and CH2)	10 mV/DIV
SWEEP TIME/DIV	1 ms/DIV
HORIZONTAL MODE	A
CH3, CH4	0.1 V
TRIG.COUNT	OFF
DELAY POSITION	OFF

Table 2

# ADJUSTMENT

## 1. POWER SUPPLY & CRT SECTION ADJUSTMENTS

Item	Adjustment VR (TC)	P.C.B.	Procedure
− 10 V	VR1	X68-1500	Adjust VR1 so that the voltage at pin 8 of the connector P17 is − 10.00 V.
Intensity	VR1	X68-1510	Display the spot on the CRT screen, and adjust VR1 so that the spot disappears when the INTEN knob is set to the 9 o'clock position.
Focus Center	VR2	X68-1510	Push the FOCUS knob in (for the FOCUS operation) and then set it to the mechanical center position. Pull the knob out (for the ASTIG operation), display a spot on the screen, and adjust the ASTIG control and VR2 to minimize the dimension of the spot.
CRT Center	VR513	X73-1760	VERTICAL MODE: CH1, CH2, ADD Make the luminescent line overlap at each $\blacktriangleleft$ position. Adjust VR513 so that the luminescent line is moved to the center of the CRT screen.
Vertical Center Voltage	VR3	X80-1100	Turn off R/O. In the state of CRT Center Adjustment, adjust VR3 so that the voltage at pin 1 of the connector P14 becomes 34.5 V.
Horizontal Center Voltage	VR102	X80-1100	Engage the CH1 mode. Activate the X-Y operation mode, and set so that the spot moves to the center of the CRT. Adjust VR102 so that the voltage at pin 1 of the connector P15 becomes 67.5 V.
R/O Vertical Gain	VR4	X80-1100	Set the $\Delta$ V VR control to "MIN" and "MAX" ( $\odot$ $\ominus$ ) in turns. Adjust VR4 so that the separation between these two settings for the cursor is of 8 divisions of the scale.
R/O Vertical Position	VR201	X80-1100	In the state of the R/O Vertical Gain Adjustment, adjust VR201 to meet the following scale values: 0 division — $\odot$ 8 divisions — $\ominus$
R/O Horizontal Gain	VR101	X80-1100	Set the $\Delta$ T VR control to "MIN" and "MAX" ( $\odot$ $\ominus$ ) in turns. Adjust VR101 so that the separation between these two settings for the cursor is of 10 divisions of the scale.
R/O Horizontal Position	VR202	X80-1100	In the state of R/O Horizontal Gain Adjustment, adjust VR202 to meet the following scale values: 0 division — $\odot$ 10 divisions — $\ominus$

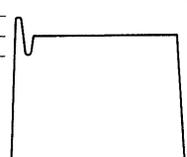

## 2. VERTICAL SECTION ADJUSTMENTS

Item	Adjustment VR (TC)	P.C.B.	Procedure
CH2 INV Balance	VR201	X75-1180	Adjust VR201 so that even when the CH2 INV switch is turned ON/OFF repeatedly, the luminescent lines does not move.
CH2 INV Position	VR101	X75-1180	Short between pin 1 and pin 3 at P5. Set the vertical mode to "CH1", "CH2", then "ADD". Set it to the scale center by " $\blacktriangleleft$ POSITION". Remove the short-circuiting. Adjust VR101 so that the deviated luminescent line comes to the scale center.
CH1 Step ATT Balance	VR103 VR101	X73-1760	Adjust VR103 so that the position of the luminescent line does not change even when the vertical attenuator is selected between 1 and 2 mV range. Switch the range between 2 and 5 mV ranges, and perform the same adjustment using VR101. Make the adjustment in the 5 mV range with reference to the 2 mV range.

# ADJUSTMENT

Item	Adjustment VR (TC)	P.C.B.	Procedure
CH2 Step ATT Balance	VR203 VR201	X73-1760	Adjust in the same way as for CH1.
CH1 Position Center	VR503	X73-1760	CH1 POSITION : Mechanical center position CH1 VOLTS/DIV : 10 mV Adjust VR503 so that the trace is located on the center of the screen.
CH2 Position Center	VR506	X73-1760	Adjust in the same way as for CH1.
CH3 Position Center	VR509	X73-1760	Adjust in the same way as for CH1.
CH4 Position Center	VR512	X73-1760	Adjust in the same way as for CH1
CH1 Variable Balance	VR104	X73-1760	Adjust VR104 so that the position of the luminescent line does not change even if the VARIABLE knob is rotated. Vary the settings of the VOLTS/DIV and VARIABLE controls and see if the trace position also moves; if it does, adjust VR103, 101 and 104 again.
CH2 Variable Balance	VR204	X73-1760	Adjust in the same way as for CH1.
CH1 Gain	VR501	X73-1760	CH1 VOLTS/DIV: 10 mV Input a square wave signal having an amplitude of 50 mV, and adjust VR501 so that the CRT amplitude becomes 5 div.
CH1 1 mV Range Gain	VR102	X73-1760	CH1 VOLTS/DIV: 1 mV Input a square wave signal having an amplitude of 5 mV, and adjust VR102 so that the CRT amplitude becomes 5 div.
CH2 Gain	VR504	X73-1760	Adjust in the same way as for CH1.
CH2 1 mV Range Gain	VR202	X73-1760	Adjust in the same way as for CH1.
CH3 Gain	VR507	X73-1760	CH3 VOLTS/DIV: 0.5 V Input a square wave signal having an amplitude of 0.5 V, and adjust VR507 so that the CRT amplitude becomes 5 div.
CH4 Gain	VR510	X73-1760	Adjust in the same way as for CH3.
CH1 Waveform Shaping	TC105 TC103	X75-1180	AC-GND-DC: DC Apply 1 kHz square wave to CH1 input (with the amplitude extending over 4 to 6 div). Set CH1 VOLTS/DIV to 0.1 V range (and 1 V range), and adjust TC105 (and TC103) so that the waveform becomes flat in both ranges.
CH1 Input Capacity	TC104 TC102	X75-1180	AC-GND-DC : DC CH1 VOLTS/DIV : 10 mV Connect the capacity meter to the CH1 input, and measure the input capacity in the 10 mV range. Adjust TC104 and TC102, alternately, so that the input capacity in the 0.1 V and the 1 V ranges equals the same capacity as in the 10 mV range.
CH2 Waveform Shaping	TC205 TC203	X75-1180	Adjust in the same way as for CH1.
CH2 Input Capacity	TC204 TC202	X75-1180	Adjust in the same way as for CH1.
CH3 Waveform Shaping	TC302	X75-1180	Apply 1 kHz square wave to CH1 input (with the amplitude extending over 4 to 6 div). Set CH3 volts/div to 0.5 V range, and adjust TC302 so that the waveform becomes flat.

# ADJUSTMENT

Item	Adjustment VR (TC)	P.C.B.	Procedure
CH3 Input Capacity	TC301	X75-1180	Connect the capacity meter to the CH3 input, and measure the input capacity in the 0.1 V range. Adjust TC301, so that the input capacity in the 0.5 V range equals the same capacity as in the 0.1 V range.
CH4 Waveform Shaping	TC402	X75-1180	Adjust in the same way for CH3.

## 3. TRIGGER SECTION ADJUSTMENTS

Item	Adjustment VR (TC)	P.C.B.	Procedure
FIX Level Center	VR1	X74-1480	VERTICAL MODE : CH1 AC-GND-DC : DC TRIG. SOURCE : VERT V. VARIABLE : CAL HORIZONTAL MODE : A SWEEP TIME/DIV : 0.2 ms CH1 VOLTS/DIV : 0.1 V Input a 1 kHz sine wave into CH1, and adjust the oscillator so that the CRT amplitude becomes 6 div. Adjust VR1 so that start point of the luminescent line is at the center of the CRT (vertical direction).
A TRIG. DC Coupling	VR601(CH1) VR602(CH2) VR603(CH3) VR604(CH4)	X73-1760	After adjusting the trigger level center, set the TRIGGERING COUPLING to the DC position. Adjust VR601 so that the start point of the luminescent line is at the same position as in the AC mode.
B TRIG. Level Center	VR4	X74-1480	VERTICAL MODE : CH1 B. COUPLING : AC TRIG. SOURCE : VERT SWEEP TIME/DIV : 0.2 ms HORIZONTAL MODE : B LEVEL : Mechanical center CH1 VOLTS/DIV : 0.1 V Input a 1 kHz sine wave to CH2, and adjust the oscillator so that the CRT amplitude becomes 6 div. Adjust VR4 so that start point of the luminescent line is at the center of the CRT (vertical direction).
B TV sensitivity	VR3	X74-1480	V. MODE : CH1 TRIG. SOURCE : VERT AC-GND-DC : DC VOLTS/DIV : 0.2 V SWEEP TIME/DIV : A 10 $\mu$ s. B 5 $\mu$ s HORIZONTAL MODE : ALT A. COUPLING : TV LINE Connect the jig to CH1 and apply 100 kHz square wave through the jig. Adjust SLOPE +/- until triggering occurs. Perform the adjustment until the triggering amplitude becomes 0.8 div or less. <div style="text-align: center; margin-top: 10px;"> </div> <div style="margin-top: 20px;"> </div>

# ADJUSTMENT

## 4. HORIZONTAL SECTION ADJUSTMENTS

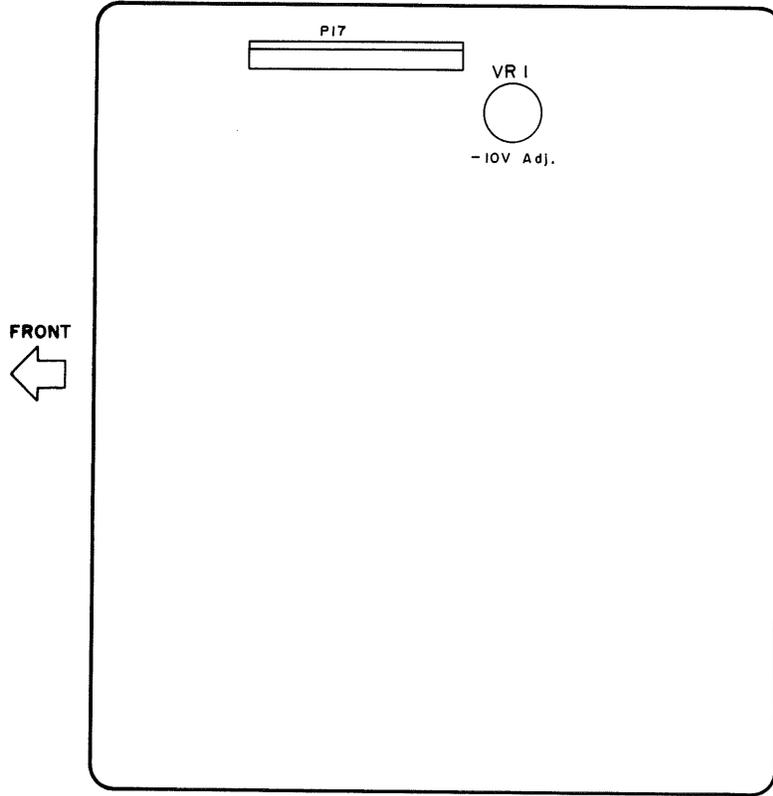

Item	Adjustment VR (TC)	P.C.B.	Procedure
A SWEEP Time	VR301	X74-1480	SWEEP TIME/DIV: 1 ms Input a 1 ms marker signal into CH1. Adjust VR301 so that the peak of the marker signal matches the CRT scale divided in 1 div.
	VR307	X74-1480	SWEEP TIME/DIV: 1 ms Input a 1 ms marker signal into CH1, and match the peak of the marker signal with the CRT scale divided in 1 div. Set to the X10 MAG status, and adjust VR307 so that the interval between peaks becomes 10 div.
	VR103	X80-1100	SWEEP TIME/DIV: 0.2 $\mu$ s Input a 0.2 $\mu$ s marker signal into CH1. Set to the X10 MAG status, and adjust the horizontal POSITION so that the peak of the waveform is at the vertical scale line at the center of the CRT. Release the X10 MAG mode and adjust VR103 so that the peak of the waveform matches the vertical scale line at the center of the CRT.
	TC101	X74-1480	SWEEP TIME/DIV: 2 $\mu$ s Adjust TC101 in the same way as for 1 ms adjustment.
	TC302		SWEEP TIME/DIV: 20 ns Adjust TC302 in the same way as for 1 ms adjustment.
	TC103	X80-1100	SWEEP TIME/DIV: 50 ns X10 MAG : ON Input a 5 ns marker signal into CH1. Adjust TC103 so that the peak of the marker signal matches the CRT scale divided in 1 div.
	TC101	X80-1100	SWEEP TIME/DIV: 20 ns X10 MAG : ON Input a 2 ns sine wave signal into CH1. Adjust TC101 so that the peak of the marker signal matches the CRT scale divided in 2 div. Repeat this adjustment for 20 ns, 5 ns, then 2 ns to obtain optimum point.
B SWEEP Time	VR302	X74-1480	SWEEP TIME/DIV: 1 ms Input a 1 ms marker signal into CH1. Adjust VR302 so that the peak of the marker signal matches the CRT scale divided in 1 div.
	VR104	X74-1480	SWEEP TIME/DIV: 1 ms ~ 5 ms Input a 1 ms ~ 5 ms signal into CH1, and adjust in the same way as for 1 ms
	TC102	X74-1480	SWEEP TIME/DIV: 2 $\mu$ s Input a 2 $\mu$ s marker signal into CH1, and adjust in the same way as for 1 ms adjustment.
	TC303	X74-1480	SWEEP TIME/DIV: 20 ns Input a 20 ns marker signal into CH1, and adjust in the same way as for 1 ms adjustment.

# ADJUSTMENT

Item	Adjustment VR (TC)	P.C.B.	Procedure
A Sweep Position	VR304	X74-1480	HORIZ. MODE : A SOURCE : VERT VERTICAL MODE : CH1 A SWEEP TIME/DIV : 1 ms TRIG. MODE : AUTO Apply a 1 ms marker signal to CH1 to display a waveform to the center of the CRT screen. Rotate the ◀► POSITION control to maximum clockwise. Measure the deviation between the starting point of the trace and the center of the graticule line. Next, rotate the ◀► POSITION control to maximum counterclockwise and measure the distance between the 12th peak of the waveform and the center of the graticule line. Adjust VR304 so that these deviations will have the same width.
B Sweep Position	VR305	X74-1480	HORIZ. MODE : ALT SLOPE : + A, B INTEN : Fully counterwise Operate ⬆ TRACE SEP control to separate the A sweep and B sweep. Set the A VARIABLE to CAL. Adjust VR305 to align the starting point of B sweep with that of A sweep in the horizontal position.
X Gain	VR303	X74-1480	CH2 VOLTS/DIV : 10 mV      CH2 AC-GND-DC : AC HORIZONTAL MODE : X-Y      V. VARIABLE : CAL Input the square wave signal having an amplitude of 50 mV into CH2, and adjust VR303 so that the CRT amplitude in the horizontal direction becomes 5 div.
X Position	VR306	X74-1480	VERTICAL MODE : CH1      TRIG. SOURCE : CH1 CH1/CH2 AC-GND-DC : GND      HORIZONTAL MODE : A SWEEP TIME/DIV : 1 ms Set the scope controls to display a trace to the graticule center. Adjust VR306 to position to trace to horizontal graticule when switched the HORIZ. MODE switch to X-Y position. Clockwise rotation of channel 1 position control should move up to 5 divisions upward and counterclockwise rotation should move up to 5 divisions downward.
Delay time	VR101 VR102	X74-1480	HORIZ. MODE : ALT CH1/CH2 AC-GND-DC : GND A SWEEP TIME/DIV : 1 ms B SWEEP TIME/DIV : 0.2 μs Rotate the DELAY POSITION control to 0.20 position and set the scope controls to coincide A trace with the left end of the graticule scale, using the horizontal position control. Adjust VR101 to position B trace (intensified portion) to 0.2 div position. Adjust VR102 to position B trace to 10 div. position (right end of the graticule scale) when rotated the DELAY POSITION control to 10.00 position.
CAL Voltage	VR5 VR6	X81-2330	Apply a CAL signal to channel 1 input. Adjust VR5 so that one period becomes 0.1 ms (10 div). Adjust VR6 so that the amplitude becomes 0.2 V (5 div.)

## CTM5020 PIN ASSIGNMENT (100-pin FPT) (with RAM)

### CTM5020 PIN DESCRIPTION

Pin No.	I/O	Pin Name	Function
1	I	CONT	Selection between X-Y mode and normal mode
2	I	A13	Address bus A13
3	-	VDD	+ 5 V power supply
4	I	A14	Address bus A14
5	I	A15	Address bus A15
6	O	INT0	1/2 period of ROSF signal (Open pin)
7	O	VX3	Selection signal of analog switch to input the endless VR voltage
8	O	VX2	Selection signal of analog switch to input the endless VR voltage
9	O	VX1	Selection signal of analog switch to input the endless VR voltage
10	O	VX0	Selection signal of analog switch to input the endless VR voltage
11	O	DA0	Output (8004H) D0 D/A data (LSB or D8)
12	O	DA1	Output (8004H) D1 D/A data (D1 or D9)
13	O	DA2	Output (8004H) D2 D/A data (D2 or D10)
14	O	DA3	Output (8004H) D3 D/A data (D3 or MSB)
15	-	VSS	GND
16	O	DA4	Output (8004H) D4 D/A data (D4)
17	O	DA5	Output (8004H) D5 D/A data (D5)
18	O	DA6	Output (8004H) D6 D/A data (D6)
19	O	DA7	Output (8004H) D7 D/A data (D7)
20	O	DA8	Output (8005H) D0 (Open pin)
21	O	DA9	Output (8005H) D1 (Serial blanking control signal)
22	O	ROR	Readout monitor terminal

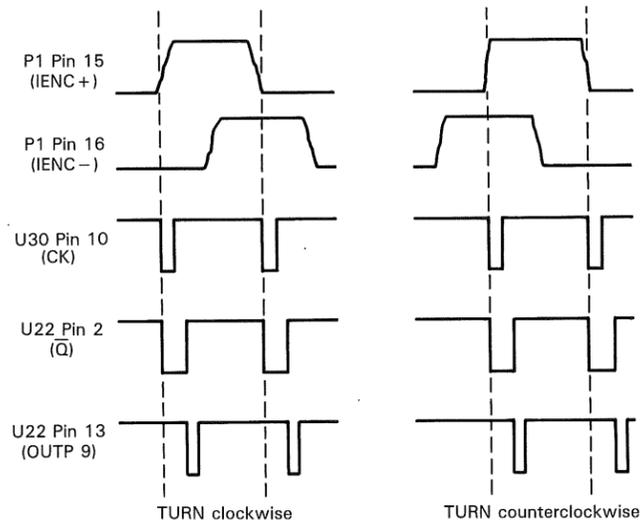

Pin No.	I/O	Pin Name	Function
23	I	ROA	Readout monitor terminal
24	O	LEVX	Output (8005H) D7 D/A Data D8~MSB Latch signal
25	I	TCL	Test pin (UDD)
26	I	TSD0	Test pin (GND)
27	I	TSD1	Test pin (GND)
28	-	VDD	+ 5 V power supply
29	I	TSD2	Test pin (GND)
30	O	AX2	Selection signal of analog switch to output the cursor, H Variable, Delay Position, H Position voltage
31	O	AX1	Selection signal of analog switch to output the cursor H variable, Delay Position, H Position voltage
32	O	AX0	Selection signal of analog switch to output the cursor H variable, Delay Position, H position voltage
33	O	AX3	Selection signal of analog switch to output the cursor H variable, Delay Position, H Position voltage
34	O	HS2	Selection signal of analog switch for the readout X-axis signal
35	O	HS1	Selection signal of analog switch for the readout X-axis signal
36	O	TDIO	Test pin (VDD)
37	I	TWE	Test pin (VDD)
38	I	TCK1	Test pin (VDD)
39	I	TST1	Test pin (VDD)

Pin No.	I/O	Pin Name	Function
40	-	VSS	GND
41	I	TST2	Test pin (VDD)
42	I	TADD	Test pin (VDD)
43	I	TCK2	Test pin (VDD)
44	O	VS2	Selection signal of analog switch for the readout Y-axis signal
45	O	VS1	Selection signal of analog switch for the readout Y-axis signal
46	O	VA0	Character Y-axis DAC data
47	O	VA4	Character Y-axis DAC data
48	O	VA3	Character Y-axis DAC data
49	O	VA2	Character Y-axis DAC data
50	O	VA1	Character Y-axis DAC data
51	O	GETD	Character X-axis data latch clock
52	O	CA0	Character counter data
53	-	VDD	+ 5 V power supply
54	O	CA4	Character counter data
55	O	CA3	Character counter data
56	O	CA2	Character counter data
57	O	CA1	Character counter data
58	O	CD3	Character ROM address
59	O	CD2	Character ROM address
60	O	CD4	Character ROM address
61	O	CD1	Character ROM address
62	O	CD5	Character ROM address
63	O	DC4	Dot counter data
64	O	CD7	Character ROM address
65	-	VSS	GND
66	O	DC3	Dot counter data
67	O	DC2	Dot counter data
68	O	CD6	Character ROM address
69	O	DC1	Dot counter data

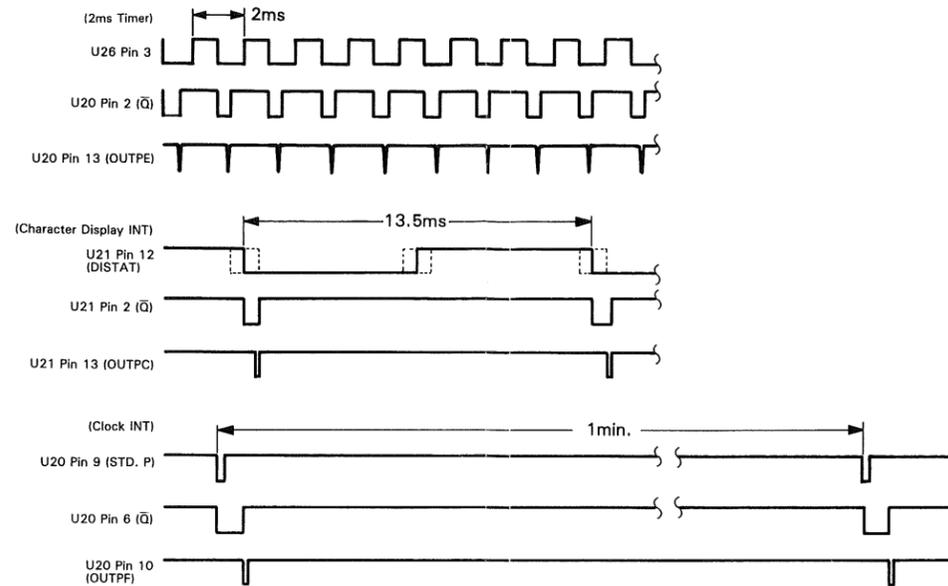

Pin No.	I/O	Pin Name	Function
70	O	DC0	Dot counter data
71	O	CD0	Character ROM address (Open pin)
72	I	DO7	Character ROM Y-axis DAC data
73	I	DO6	Character ROM Y-axis DAC data
74	I	DO5	Character ROM Y-axis DAC data
75	I	DO4	Character ROM Y-axis DAC data
76	I	DO3	Character ROM Y-axis DAC data
77	I	SING	Terminal for SINGLE signal
78	-	VDD	+ 5 V power supply
79	I	R10M	10 MHz clock
80	I	10M	10 MHz clock
81	I	HLDF	Holdoff input
82	I	SGA	Sweep gate
83	I	ROSP	Readout off
84	I	ROD	Character counter reset
85	O	HLDL	Holdoff output
86	O	ROUB	Readout unblanking
87	O	ROB	Readout blanking
88	O	ROQ	Readout request
89	O	ROED	Readout end
90	-	VSS	GND
91	I	D7	Data bus D7
92	I	D5	Data bus D5
93	I	D3	Data bus D3
94	I	D1	Data bus D1
95	I	ALE	Address/Data latch
96	I	D6	Data bus D6
97	I	D4	Data bus D4
98	I	D2	Data bus D2
99	I	D0	Data bus D0
100	I	WR	Write timing signal
