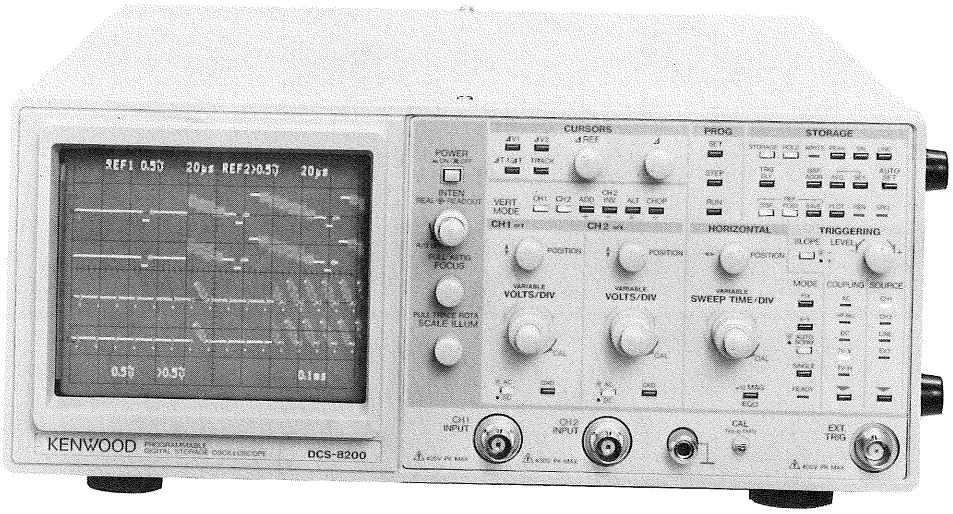
KENWOOD

PROGRAMMABLE DIGITAL STRAGE OSCILLOSCOPE

DCS-8200

SERVICE MANUAL

KENWOOD CORPORATION



WARNING

The following instructions are for use by qualified personnel only. To avoid electric shock, do not perform any servicing other than contained in the operating instructions unless you are qualified to do so.

CONTENTS

SPECIFICATIONS

【Real-Time section】

CRT

Type : 150 mm rectanguler with internal graticule
Acceleration voltage : 12 kV
Effective Surface : 8×10 div (1 div = 10 mm)

Vertical Axis (CH1 and CH2)

Sensitivity : 1 to 5 mV/div ±3 %
Attenuator : 1 to 5 mV/div 1-2-5 step, 5 ranges
Input impedance : 1 MΩ±1 %, 22pF ± 3pF
Freq. responce : DC: DC to 50 MHz -3dB (5mV to 5V/div)
DC to 5 MHz -3dB (1 to 2mV/div)
AC: 5 Hz to 50 MHz -3dB (5mV to 5V/div)
5 Hz to 5 MHz -3dB (1 to 2mV/div)
Rise time : 7 ns or less (50MHz)
Operation modes : CH1, CH2, ALT, CHOP, ADD (CH1+CH2)
CHOP frequency : Approx. 250 kHz
Channel polarity : Possible only with CH2
⚠Max. input voltage : 800Vp-p, or 400V (DC+AC peak)

Horizontal axis (CH2 input, except for ×10 magnification)

Operation modes : Switchable to X-Y mode with horizontal mode,
CH1: Y-axis CH2: X-axis
Sensitivity : Same as vertical axis (CH2)
Input impedance : Same as vertical axis (CH2)
Freq. responce : DC: DC to 1 MHz (-3dB)
AC: AC to 1MHz (-3dB)
X-Y phase difference : 3° or less at 100 kHz
⚠Max. input voltage : Same as vertical axis (CH2)

Sweep

Sweep system : NORM, AUTO, SINGLE
Sweep time : 0.5s/div to 0.1μs/div ±3 %, 1-2-5 step, 21 ranges
Sweep magnification : 10 times ±5 % (real-time only)
Linearity : ±3 % (×10MAG : ±5 %)

Triggering

Internal trigger : CH1, CH2, LINE
External trigger : EXT
External trigger input impedance : 1 MΩ
⚠Max. external trigger input voltage : 800Vp-p, or 400V (DC+AC peak)
Trigger coupling : AC, $HF_{REJ.}$, DC, TV-FRAME, TV-LINE
Trigger sensitivity :

	Frequency Range	Internal	External
DC	DC to 10 MHz	1 div	0.1 Vp-p
	DC to 50 MHz	2 div	0.2 Vp-p
AC	10 Hz to 10 MHz	1 div	0.1 Vp-p
	10 Hz to 50 MHz	2 div	0.2 Vp-p
HFrej	Increased minimum sync amplitude for above 10kHz.		
TV	FRAME, LINE	1 div	0.1 Vp-p

AUTO : Same as above specification for above 50Hz.
FIX : Same as above specification for above 40Hz.

Calibration voltage : Square wave, positive polarity, 1 Vp-p ±2 %, 1 kHz ±3 %

SPECIFICATIONS

【Storage section】

Vertical resolution

Data length : 8-bit (25 dot/div)
Dynamic range : Approx. 10 div

Freq. responce

Effective storage frequency : DC: DC to 8 MHz, (sin interpolation)
AC: 5 Hz to 8 MHz, (sin interpolation)
Equivalent sampling : DC: DC to 50 MHz
AC: 5Hz to 50 MHz

Rise time

Effective rise time : 80 ns or less

Memory capacity

NORM	:	Display memory (including REF memory)	2KW × 2/CH (200 dot/div)
		Acquisition memory	16KW/CH
		REF memory	16KW/CH
Equivalent sampling	:	Display memory (including REF memory)	2KW × 2/CH (200 dot/div)
		Acquisition memory	2KW/CH
		REF memory	2KW/CH
Roll	:	Display memory (including REF memory)	2KW × 2/CH (200 dot/div)
		Acquisition memory	16KW/CH
		REF memory	16KW/CH
Averaging	:	Display memory (including REF memory)	2KW/CH (200 dot/div)
		Acquisition memory	5KW/CH
X-Y	:	Display memory (including REF memory)	2KW/CH (200 dot/div)
		Acquisition memory	2KW/CH
		REF memory	2KW/CH

REF memory data backup (32KW) :
System : Capacitance system
Life : 7 days or more

Sweep time

Equivalent sampling : 20 ns/div to 5μs/div
NORM : 0.1 μs/div to 100 ms/div (0.1 μs/div to 5μs/div is magnification range).
Roll : 0.2s/div to 500s/div
* Max. sampling speed is 20 MS/s, 2-channel sync.

Storage system

NORM : Data updated for every trigger input
SINGLE : Single sweep write
AVERAGE : 2 to 256 times, average of adding (2, 4, 8...256)
PEAK DETECTOR : 100 ns glitch detection
Effective sweep range (500s/div to 0.1ms/div)
ROLL : Data is recorded on screen continuously and updated.
Equivalent sampling : Sequential sampling system

Magnification and reduction

Magnification and reduction are performed centered on the CRT with SWEEP TIME/DIV control (when the starting point is set at the left edge of the screen.).
Magnification : Max. 100×
Reduction : Max. ×1/10

Interpolation

Systems : Linear interpolation, sin interpolation

Trigger delay

Pre-trigger : Up to -80 times of SWEEP TIME/DIV setting (integer times setting)
Post-trigger : Up to +10,000 times of SWEEP TIME/DIV setting (integer times setting)

X-Y

NORM : DC to 800 kHz
Equivalent Sampling : DC to 50 MHz

SPECIFICATIONS

PEN OUT

Output : CRT display and hard copy (25 KW)
- Y axis: Output voltage, 0.5V/div
  Output impedance, approx. 2kΩ
  Readout speed, 10ms/word and 50ms/word
- X axis: Output voltage, 0.5v/div
  Output impedance, approx. 2kΩ
  Readout speed, 10ms/word and 50ms/word

PEN DOWN

Output level : TTL level ("L" during operation)

Waveform operation

CH1 + CH2, CH1 − CH2, CH1 × CH2, CH1 ÷ CH2

Plotter output

Output : RS-232C, HP-GL command (made by Muto Industries, for HP-GL plotter), for CRT hard copy, data transmission only.

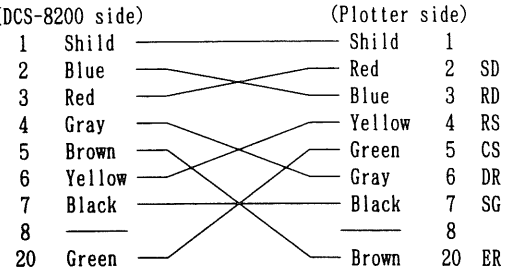
Baud rate : 9600, 4800, 2400 and 1200 bps.

Transfer system : Data length 8-bit, no parity, stop bit is 2-bit fixed, hardware-hand shake.

Signals :

FG (Frame Ground)	
SD (Send Data)	→ plotter
RD (Receive data)	← plotter
RS (Request to send)	→ plotter
CS (Clear to Send)	← plotter
DR (Data Set Ready) Request to send from plotter	← plotter
ER (Data Terminal Ready) Permission to send from plotter	→ plotter
SG (Signal Ground)	

Connections :



【Readout section】

Calendar

Calendar display : Year, month, day, O'clock and minute (set with panel switch)

Clock accuracy : ±2 min./month

Battery life : approx. 30,000 hours

Setting values

Displays ●CH1/CH2 Scale Factor (with probe detector) ●GND ●V-UNCAL ●CH2 INVERT ●Sweep Scale Factor (MAG conversion) ●H-UNCAL ●Four operations (+, −, ×, ÷) ●Scroll Address ●AVG times setting ●Trigger Point (Post-trigger, Pre-trigger) ●EQU ●ROLL ●AUTO SET setting ●Program Steps ●REF Memory Condition Setting ●Trigger Time ●PEAK DETECTOR Setting

Cursor

Cursor mode

- ΔV1 : Voltage difference between ΔREF and ΔCURSOR due to CH1 scale factor
- ΔV2 : Voltage difference between ΔREF and ΔCURSOR due to CH2 scale factor
- ΔT : Time difference between ΔREF and ΔCURSOR due to sweep scale factor
- 1/ΔT : Frequency between ΔREF and ΔCURSOR due to sweep scale factor
- RATIO : Voltage ratio and time ratio between ΔREF and Δcursors, supposing 5-division on the CRT as 100%
- PHASE : Phase difference between ΔREF and Δcursors, supposing 5-division on the CRT as 360°
- TRACKING : Move ΔREF CURSOR and ΔCURSOR in parallel.

SPECIFICATIONS

Cursor measurment

Measurment accuracy ±2 %

Measuring range Vertical direction : ±3.6 div or more from center of CRT

Horizontal direction : ±4.6 div or more from center of CRT

【Other functions】

Program

Program range :

CURSORS, VERT MODE, VOLTS/DIV, ▲▼ POSITION, AC/DC, GND, ◀▶ POSITION, SWEEP TIME/DIV, ×10MAG/EQU, HORIZONTAL MODE, TRIGGERING SLOP, TRIGGERING SOURCE, STORAGE, HOLD, PEAK, SINE, LINEAR, TRIG DLY, DISP.ADDR, AVG, REF DISP

No. of steps : Max. 20 steps

Auto Range

Vertical axis : 2, 4 and 6 divisions

Horizontal axis : 2 and 5 cycles

PEAK DETECTOR

MAX value display

MIN value display

MAX/MIN value display

【General specifications】

Power supply : AC 100, 120, 220, 240V ±10 % (Max. 250V) 50/60 Hz, approx. 75W

Dimensions : 319 mm wide ×132 mm high ×380 mm deep

Max. dimensions : 341 mm wide ×132 mm high ×442 mm deep

Weight : Approx. 11 kg

Specifications temperature and humidity:

10 to 35℃, not more than 85% humidity

Operation temperature and humidity:

0 to 40℃, not more than 85% humidity

Accessories : 1 instruction manual, 2 PC-33 probes, 1 power cord, 2 Replacement fuses.

【Interface unit】

GP-IB (Complies with IEEE Standard 488-1978).

Subsets SH1 : (Transmission handshake) all functions

AH1 : (Reception handshake) all functions

T5 : (Talker) Basic talker, serial pole, and talker only mode. Has talker release function with MLA.

TE0 : (Talker address extension) Does not have function.

L4 : (Listener) Basic listener. Has listener release function with MTA.

LE0 : (Listener address extension) Does not have function.

SR1 : (Service request) Has all functions

RL2 : (Remote/local) Has remote/local function. Does not have local lock out (LLO) function.

PP0 : (Parallel pole) Does not have function.

DC1 : (Device clear) Has all functions.

DT0 : (Device trigger) Does not have function

C0 : (Controller) Has no functions.

Delimiter : CR/LF and EOI

Data code : ASCII code and binary code

SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. The specified voltage is shown at the fuse holder of the AC inlet. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

Line voltage

This instrument operates using ac-power input voltages that 100/120/220/240 V at frequencies from 50 Hz to 60 Hz.

Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the oscilloscope at earth ground. Do not attempt to defeat the ground wire connection or float the oscilloscope; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.
The optional power cords are shown as follows in Fig. 1.

Line fuse

The fuse holder is located on the rear panel and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

Voltage conversion

This oscilloscope may be operated from either a 100 V to 240 V, 50/60 Hz power source. Use the following procedure to change from 100 to 240 volt operation or vice versa.

1. Remove the fuse holder.
2. Replace fuse F 1 with a fuse of appropriate value, 1.6 amp for 100 VAC to 120 VAC operation, 1 amp for 220 VAC to 240 VAC operation.
3. Reinsert it for appropriate voltage range.
4. When performing the reinsertion of fuse holder for the voltage conversion, the appropriate power cord should be used. (See Fig. 1.)

Plug configuration	Power cord and plug type	Factory installed instrument fuse	Line cord plug fuse	Parts No. for power cord
	North American 120 volt/60 Hz Rated 15 amp (12 amp max; NEC)	1.6 A, 250 V Fast blow 6×30 mm	None	Cord: E30-1820-05
	Universal Europe 220 volt/50 Hz Rated 16 amp	North Europe 1 A, 250 V Slow blow 5×20 mm Other Europe 1 A, 250 VV Fast blow 6×30 mm	None	Cord: E30-1819-15
	U.K. 240 volt/50 Hz Rated 13 amp	1 A, 250 V Fast blow 6×30 mm	0.8 A Type C	—

	Switzerland 240 volt/50 Hz Rated 10 amp	1 A, 250 V Fast blow 6×30 mm	None	—

Fig. 1 Power Input Voltage Configuration

CIRCUIT DESCRIPTION

Vertical Attenuator Circuit (X75-1200-00)

The attenuator rotary switches for channel 1 and channel 2 include the attenuator circuits built into the switches themselves. The vertical input signal from the BNC input connector is switched by the AC/DC/GND switch and input to the first stage attenuator circuit. This attenuator input signal is attenuated by a factor of 1/1, 1/10, or 1/100 (selected by the vertical rotary switch) and input to the first stage buffer amplifier, which is formed by Q1, Q2, Q3, Q4, Q5, and U1 in channel 1 and by Q101, Q102, Q103, Q104, Q105, and U101 in channel 2. The buffer amplifier first divides the input signal into high and low frequency components and impedance converts the high frequency components with Q1 (Q101) and the low frequency components with U1 (U101). These signals are combined at the base of Q5 (Q105) and output from the emitter.

Since OP amps with a small DC offset drift are used for U1 and U101, the outputs from Q5 and Q105 have good temperature stability.

This output signal is input to the second stage attenuator, which has a selectable attenuation of 1/1, 1/2, 1/4, or 1/10, and then output to the second amplifier. The second stage attenuator has a low input impedance, and thus provides attenuated output with excellent frequency characteristics. Also, a switch is provided that sets the second amplifier to a factor of 5 amplification when a 1 mV or 2 mV sensitivity is selected. Q4 (Q104) is a fixed current source load for Q3 (Q103), while Q1, Q2, and D1 (Q101, Q102, and D102) are input protection elements.

Vertical Preamp Circuit (X73-1930-00)

The signal output from the attenuator circuits is input to the second amplifier, which consists of the dual transistor's Q1 and Q2 (Q201 and Q202 in channel 2). The 1 mV/2 mV amplifier is a switchable gain amplifier, and either Q1 or Q2 (Q201 or Q202) can be driven by switching between the transistor Q151 and Q152 (Q351 and Q352) current sources.

When the oscilloscope is set to ranges other than 1 mV or 2 mV per division, Q151 (Q351) is selected and the Q1 (Q201) amplifier operates, and when either a 1 mV or 2 mV per division range is set, Q152 (Q352) is selected and the Q2 (Q202) amplifier operates at the normal factor of five gain. TH1 (TH201) is connected at the Q2 (Q202) emitter to compensate for gain drift at the 1 mV and 2 mV per division settings. Transistor's Q6 and Q2 (Q206 and Q202) are attached at the second amplifier output to form the variable circuit associated with the attenuator.

A GaAsFET transistor is used for Q6 (Q206), and since these transistors are selected for good linearity, they form continuously variable attenuators with good frequency characteristics.

The output signal from the second amplifier is input to the collectors of transistor's Q7 and Q8 (Q207 and Q208), passed through transistor's Q121 and Q122 (Q321 and Q322), and output as the trigger signal. The output on the opposite side of the trigger signal in channel 2 is output as the X signal.

The signal passes through the emitter-follower formed by Q7 and Q8 (Q207 and Q208) and is input to the third amplifier of Q9 and Q10 (Q209 and Q210). At this stage, a differential transistor emitter load is used as a fixed current supply to realize a high CMRR, and transistor's Q12 and Q13 (Q212 and Q213) are used as a grounded base cascode amplifier in the output stage to minimize the influence of transistor feedback capacitance at high frequencies. Also, reverse phase output can be acquired from channel 2 by switching, with U301, the base potentials of the collector cross-connected transistor pairs Q212/Q213 and Q232/Q233. The vertical position circuit formed by transistor's Q14 and Q15 (Q214 and Q215) is connected to the cascode amplifier transistor Q12 and Q13 (Q212 and Q213) collectors, and forms the vertical position adjustment circuit.

The third amplifier output signal is passed through the emitter follower of transistor's Q16 and Q17 (Q216 and Q217) and input to the A/D amplifier circuit and the real-time mode circuit. First the A/D amplifier circuit input signal is input to transistor's Q143 and Q144 (Q343 and Q344). Here the signal is converted by a single sided differential amplifier and output to the A/D board A/D preamplifier through the Q145 (Q345) drive transistor.

The signal input to the real-time mode circuit enters the fourth amplifier. The fourth amplifier is a cascode amplifier formed by transistor's Q27, Q28, Q20, and Q21 (Q218, Q219, Q222, and Q223), and is provided with a vertical position fine adjustment circuit on the emitters of transistor's Q27 and Q28 (Q218 and Q219).

Note that switching between the digital mode circuit and the real-time mode circuit is only provided for channel 1, and that this function is formed by transistor's Q382 and Q381.

Transistor's Q20 and Q21 are used as the fourth amplifier (a cascode amplifier) base grounding transistors for both the digital mode and real-time mode circuits. The collectors of the channel 1 output transistor's Q20 and Q21 are connected, as are the collectors of the channel 2 output transistor's Q222 and Q223. The emitters of transistor's Q20, Q21, Q222, and Q2231are connected to the emitters of transistor's Q18, Q19, Q220, and Q221, whose bases are connected to the channel switching signals. This structure provides the vertical mode switching operation, in which the output transistors of this stage (Q20, Q21, Q222, and Q223) are turned on or off by the channel switching signals. Also, fluctuation in the operating points of ADD and other modes are suppressed by transistor Q224. Transistor's Q650 and Q630 are connected to the collectors of transistor's Q20, Q21, Q222, and Q223 as a digital mode frequency characteristics compensation circuit.

The signal is then passed through the emitter-follower formed by transistor's Q22 and Q23 and output to the bases of transistor's Q24 and Q25 to generate the fourth amplifier output, which is then input to the final amplifier (X80-1090-00). Since Q24 and Q25 are the emitter ground for the cascade amplifier, the output to the final amplifier (X80-1090-02) is a current output.

CIRCUIT DESCRIPTION

Trigger Signal Switching Circuit (X73-1930-00)

The trigger signal, which is output from the operation of each channel, passes through the trigger output amplifier formed by Q121 and Q122 (Q321 and Q322), and is input to the trigger switching circuit formed by transistor's Q401 to Q408.
A line trigger signal from external circuits and the power supply circuit is also input here. The four trigger signals are output to the horizontal sweep unit.
The trigger enable signals are connected to the bases of Q401 to Q404, whose emitters are connected to the emitters of transistor's Q405 to Q408. Thus trigger signals can be selected by turning Q405 to Q408 on or off appropriately.

Vertical Final Amplifier (X80-1090-02)

The signal sent from the vertical preamplifier is amplified at the base ground stage of the cascode amplifier formed by transistor's Q1 and Q2, and sent to the next stage through the emitter-follower formed by transistor's Q3 and Q4.
Transistor's Q5, Q6, Q7 and Q8 also have a cascode structure. The thermistor TH1 is inserted between the emitters of Q5 and Q6 to compensate for gain temperature drift, and R16, R17, C50, and C51 are used for ultra low frequency compensation. The output of this stage is passed through the emitter-follower formed by transistor's Q9 and Q10, and is then input to the final amplifier formed by transistor's Q11, Q13, Q15, and Q16 where it is amplified to a level of 2.5 V/div (single-sided). VR1 is a gain adjustment variable resistor, VR2 is the CRT centering adjustment, VR5 is the operating point adjustment, and P42 is adjusted to +37 V.
The read-out Y signal (R/O Y signal) is input to transistor's Q17 and Q18. The REAL signal and the R/O signal are switched by transistor's Q19 and Q20. D1 and D2 are inserted to improve isolation. The cursor gain and cursor Y position are adjusted with VR3 and VR4 respectively.

Power Supply Circuit (X68-1480-01)

The power supply consists of 5 regulated systems, 2 unregulated systems, and a scale illumination system.
When the power supply switch is turned on, first the −10 V provided by Q2, U1 and D8 is brought up. This −10 V is stabilized using D8 as a reference. The other voltages, i.e., +10 V, +5 V, +65 V, and +120 V use emitter outputs since the currents supplied are small.
The scale illumination voltage is rectified by D1 and controlled by Q8.

Trace Rotation and Calibration Circuits (X68-1480-01)

The trace rotation circuit drives the rotator coil located in the CRT cone from the emitter-follower formed by the Q17 and Q18 complementary transistor pair.
The calibration circuit (CAL) generates a 1 kHz square wave with a multi-vibrator oscillator circuit based on U2, and generates the 1 Vp-p CAL signal by switching that square wave with D12 and D27. The frequency is adjusted with VR5, and the level is adjusted with VR6.

Blanking Circuit and High Voltage Circuit (X68-1480-01)

The unblanking signal from P26 is inverted and amplified by the blanking amplifier formed by Q11 to Q13, and is combined with the cathode voltage by the direct-current regeneration circuit formed by D18 to D20.
Transistor's Q9 and Q10 form the autofocus inverting amplifier, and produce the focusing voltage from the blanking signal. The focus voltage is combined with the high voltage by the direct-current regeneration circuit formed by D14 to D16, and drives the focus electrode.
The −1.5 kV required for the cathode is produced by the Q15 transistor oscillator and the high voltage converter block (W02-0431-05). Negative feedback from the cathode is applied to the U4/Q14 error amplifier to acquire a stabilized high voltage from the converter oscillator circuit.

Trigger Circuit (X74-1550-00)

The trigger signal selected in the vertical preamplifier is passed through P402 and input to the trigger amplifier formed by Q1 and Q2. The Q2 output is switched between AC and DC by the trigger coupling relay K1, and input to Q51 through Q54 in TV synchronous operation, and to Q3 to Q9 in other modes, where it is amplified to ECL logic levels. Q51, D2, and D3 form a TV synchronization polarity switching circuit, and synchronization pulses are extracted by Q54 with the sync chip clamped by Q53 and D6. Of these synchronization pulses, the vertical synchronization pulses are acquired by passing through the differentiator formed by R64, C62, and C64.
The FIX circuit detects the input signal using D12, D13, C7, C8, R84, and R85, and inputs it to the gate of Q5 after passing it through the U114 analog switch and the U203 buffer amplifier.
The signal output from the trigger amplifier is wave-shaped by the Schmitt circuit formed by U112a and U112b and then the trigger slope is switched by U112c. The following horizontal sweep circuit is driven by these signal synchronization pulses.
The trigger pulses are passed through a detection circuit formed by D101, D102, Q101, and U105b and are input to U102c. When there are trigger pulses, the base of transistor Q101 will become high, and trigger pulses are received by setting U105b high, passing them through U102c, and setting the U103b reset terminal low. When there are no trigger pulses, the U103b reset terminal goes high, the system goes to the reset state, and auto-freerun begins.

CIRCUIT DESCRIPTION

Horizontal Sweep Circuit (X74-1550-00)

When a trigger pulse triggers the U103b flip-flop, the output is inverted and passed through Q114 to control Q120, and a sweep signal corresponding to the CR time constant switched by U121 to U124 and Q121 to Q123. This sweep signal is output, through U141 and U142, to the horizontal output switching circuit. Also, this sweep output is input to the comparator formed by Q171 and Q172 where the illuminated line length is determined. The hold off time is determined by C178 to C181, which are switched by U104a, R181, and Q178 to Q180.

Blanking Circuit (X74-1550-00)

The U103b flip-flop sweep gate signal is passed through the ECL to TTL converter consisting of transistor's Q187 and Q189, and the Q187 output is input to the CPU board as the equivalent sampling circuit TRIG signal trigger pulse in digital mode. The output from Q189 is input to Q201 through the gates U107a, U107c, U105c, and U107d.

U106c and U106d form a chop oscillator circuit that oscillates at about 500 kHz. This signal is mixed with the sweep gate by U107a. This signal is divided by 2 by U109a, and output to the vertical board (X73-1930-00) by P402 as the vertical switching signal after passing through U108a and U108b.

The R/O BLK signal is mixed with the sweep gate signal by U107d, the DSO-BLK signal is mixed with the sweep gate signal by U105c, and the R/O UNBLK signal is input to Q205. The BLK and UNBLK signals are mixed by Q202 and Q204 and output by Q203. U202b is a comparator that generates the R/O OFF signal.

Horizontal Output Switching Circuit (X74-1550-00)

The real-time sweep signal, the XY signal, and the digital sweep signal are switched by transistor's Q143 to Q146, Q149, and Q150. The selected signal is output to the horizontal final amplifier by P406 after passing through Q147 and Q148.

Horizontal Final Circuit (X80-1090-02)

The horizontal signal input from P24 is input to transistor's Q25 and Q26 or Q27 and Q28 (MAG × 10) from the emitters of transistor's Q23 and Q24. Q44 and Q45 perform the switching between the Q25/Q26 and Q27/Q28 pairs. Q29 and Q30 form the grounded base stage of a cascode amplifier, and the D13 to D20 limiters are inserted at the output collectors. The impedance is converted by the emitter-follower formed by Q31 and Q32, and the signal is amplified to 6 V/div (single-sided) by the final amplifier, which consists of Q33 to Q40 and Q50. The thermistor TH3 is inserted between the emitters of Q25 and Q26 to compensate for thermal drift in the gain, and the thermistor TH4 is inserted between the emitters of Q27 and Q28 to compensate for thermal drift in the gain.

On the other hand, the read-out signal is input to Q47 and Q48. The R/O REQ signal switches between Q47/Q48 and Q25/Q26 (or Q27/Q28). D5 and D6 are inserted to improve the isolation between Q47/Q48 and Q25/Q26 (or Q27/Q28).

Readout Overview

The R/O unit (X77-1720-00) is functionally constructed from 3 blocks.

1) Input Port Block

This block acquires switch information and clock data for CRT readout display.

(This block is implemented by the U1, U4 to U16, U18, U19, U23, and U50 ICs.)

2) Display Block

This block generates the X and Y axis signals for CRT readout display.

(This block is implemented by the U32, U33, U39, U40 to U42, U48, U49, and RA1 ICs and resistors.)

3) Cursor Block

This block consists of the cursor measurement A/D converter and arithmetic blocks.

(This block is implemented by the U33 to U38, U43 to U45, U47, and U51 to U53 ICs.)

Input Port Block (X77-1720-00)

This block acquires switch state data and clock data, and also transfers that data to the character generator (U32) under the control of the U1 microprocessor. The reference clock is given by a clock formed from an external 10 MHz clock and U30. The switch data required for CRT display is acquired for the microprocessor every 20 ms by an input board consisting of U5 to U13 and U50. U4 is the decoder for the input board, and its output signals G1 to G3 are output with a period of 20 ms.

Clock data is output once a minute from the U23 clock IC pin 1. The microprocessor is interrupted by a pulse signal, and accesses U23 to acquire the clock data on this interrupt.

U23 is backed up by the lithium battery B1 even when the power is off, and operates with a reference clock of 32.768 kHz provided by the quarts oscillator X2. As a result, when the battery is close to being exhausted and its voltage falls under 2 V when the power is off, the 32.768 reference clock will no longer operate. The display will indicate a clock delay and "BATT.DOWN."

Clock data maintenance is performed at power on and off by the +5 V power supply detection IC U24, which has a typical detection level of + 4.4 V.

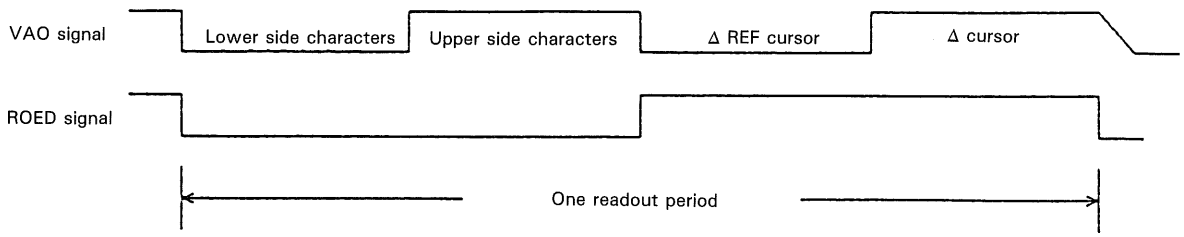
Display Block (X77-1720-00)

The random scan method (X/Y display) is used for character display, and the character generator U32 is controlled by the R/O controller U33 character counter (U33; CD1 to CD7) and the dot counter (U33; DC0 to DC4).

In real-time mode, readout display is performed with a 13.5 ms period. In storage mode, readout display and storage display are timeshared, with both readout display and storage display having periods of about 10 ms. The control signals used in this case are the ROED (R/O end) signal, and the RSTR (R/O start) signal from the A/D unit (X78-1080-00). (The storage display period is defined by the RETR signal going high, and the completion of the readout operation.)

A single readout display period is divided into four parts, consisting of the lower side characters, the upper side characters, the Δ REF cursor, and the Δ cursor. The timing is switched by the U33-89 ROED signal and the U33-46 VAO signal.

CIRCUIT DESCRIPTION



The character generator U32 holds 5 × 7 dot matrix characters, the 3 bits 1 to 3 output the X-axis data, D03 to D06 output the 4-bit Y-axis data, and D07 is the character start/end control bit. The digital signals output from U32 are converted to analog signals by the U48 X axis signal D/A converter and by the Y axis D/A converter formed by U41 and RA1. These signals are passed though the analog switches U39 and U40, and then the buffer amplifier U42. The X-axis signal is then sent to the final unit (X80-1090-02).
The character dot display is controlled by the ROUB, ROB, and ROQ signals from U33 to U86, U87, and U88. The ROB signal removes the real-time waveform display, the ROQ signal switches between the real-time waveform and readout displays, and the ROUB signal performs readout dot display.
Also, the above three signals are controlled by the ROSP signal (readout off signal (READ OFF)) from U33 pin 83.

Cursor Block (X77-1720-00)

The cursor mode resolution is 12 bits, corresponding to the full scale voltage of the cursor knob.
The cursor knob voltage is directly input to the analog switch U36, and the switched output is input to the A/D converter formed by U33, U35, U47, and U1. The analog values of the Δ REF and Δ cursor knob are converted by this A/D converter to 12-bit digital values, and the required cursor calculations are performed by the microprocessor U1. This A/D conversion is performed by comparing the cursor knob voltage to an analog voltage produced by converting the 12-bit data output by the microprocessor U1 to analog with the U35 D/A converter using the comparator U47. The conversion time for this A/D conversion is 10 ms.
The analog voltage output from the U35 D/A converter is switched between Δ REF and Δ cursor, and is held by the hold circuits as the cursor display voltage every 10 ms.
Also, the analog control system operates in a similar manner, with the input time multiplexed by the analog switches U36 and U38. The analog voltage output from the U35 D/A converter is switched by the analog switches U37 and U51 and sent to the other circuits after passing through hold circuits and the buffer amplifiers U43 to U45, U52 and U53.

CIRCUIT DESCRIPTION

Storage Display Overview

The DSC-8200 employs an equivalent sampling function that uses an A/D converter with a 20 ms per sample sampling time. In the equivalent sampling mode, time ranges from 20 ns/div to 5 μs/div are possible, and a channel 1/channel 2 simultaneous sampling method is used.

The peak hold function and the memory control function do not use the microprocessor, but are controlled completely in hardware. Since this would require an enormous number of parts if implemented in discrete components the DTM6010 gate array was developed for these functions.

The memory system consists of 16 kbytes per channel of data memory (implemented as two 8 kbyte memories), 16 kbytes per channel of REF memory, and 8 kbytes of display memory (including REF) at 2 kbytes per channel.

Note that the display method in storage mode and readout mode is not a chop method but an ALT relationship.

ALT operation control is performed by the RO-ACK signal from the R/O side and the RO-REQ signal from the storage side. That is, RO-ACK rises on the fall of the DI-STAT signal, and a storage display period starts. An R/O display period begins when the RO-REQ signal falls in response to the storage side DISP-END signal. If the DI-STAT signal is not output, storage display will not begin, and if RO-REQ is not in the low state, readout display will not begin.

A/D Preamp Block (X78-1080-00)

The signal input from P140 (P301) is input to the differential amplifier formed by Q1 and Q2 (Q13 and Q14). Here, the differential amplifier is converted to single-end, and the signal is sent to the sample and hold circuit through the Q5 (Q19) drive amplifier.

Q3 and Q4 (Q15 and Q16) are connected to the differential amplifier and the drive amplifier as a constant-current supply.

Switching in the sample and hold circuit is performed by the diode switch D11 and D12 (D22 and D23), and the diode switching circuit is driven by the Q6 and Q7 (Q18 and Q19) drive transistors.

The diode switch is in the on state during normal sampling, and during equivalent sampling is only off during hold periods.

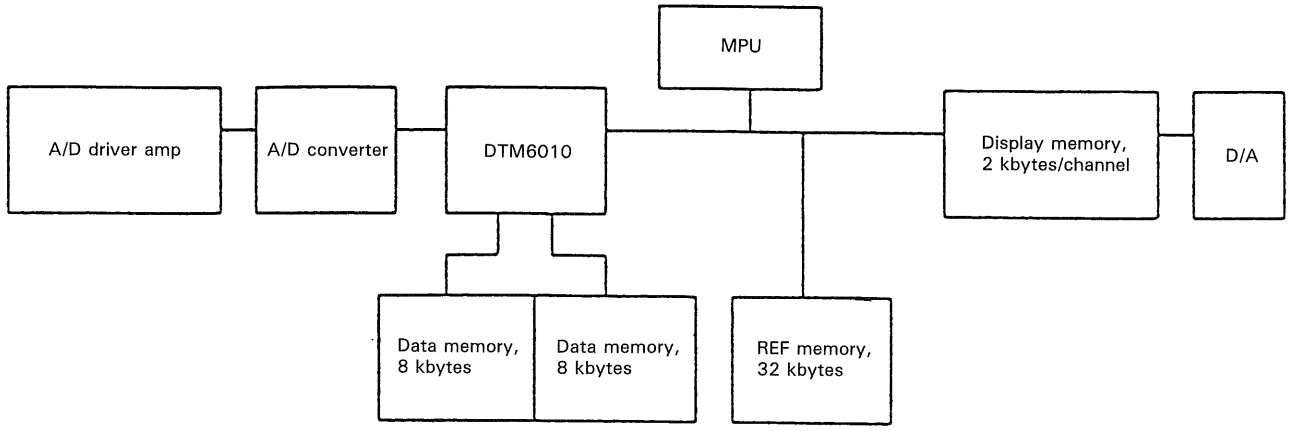
The signal output from the hold capacitor C21 (C54) is impedance converted by the Q8 (Q20) FET transistor, and Q9 (Q21) is attached as a constant-current supply for Q8.

The signal from the FET transistor is input to the differential amplifier formed by Q11 and Q12 (Q23 and Q24), and is output to the A/D converter from the Q10 (Q24) drive transistor. Q601 and Q602 (Q701 and Q702) are attached to the base of Q12 (Q24) to compensate for gain and position fluctuations in equivalent sampling mode.

A/D Converter

U1 (U10) is a 20 Mpsps CMOS video 8-bit A/D converter that operates using a two step parallel conversion method. The reference circuit is a 2 Vp-p circuit with a range from +0.6 to +2.6 V that uses a built-in A/D circuit.

Analog sampling is performed on the falling edge of the clock signal, and digital data output is delayed 2.5 clock cycles (about 18 ns) from the analog sampling point.



CIRCUIT DESCRIPTION

Data Memory Circuits

The data memory circuits U6 and U7 (U15 and U16) adopt a 2-phase ring method, and consist of two 35 ns 16-kbyte memories per channel.

Data memory control and buffering for output to the microprocessor are performed by the U2 (U20) gate array. Thus it is possible to connect the data memory directly to the microprocessor data bus.

Since there is also a peak hold function built into the U2 (U20) gate array, it also handles the input of external control signals.

Data memory address control, sample and hold pulses, and the A/D clock are acquired by the timing control circuit formed by U21, U22, and U17, and input to the address counter formed by U24 to U26. The address counter adopts a ring counter method, and therefore operates from the start of sampling until the end of sampling. When operation completes, the microprocessor reads data out of data memory by reading from the end address read port formed by U48 and U49, and switching the U12 to U14 address selector.

Display Memory Block

The U55 display memory addresses are allocated into 4 equal sections, an allocation that is performed by dividing the memory starting at the first address into CH1, CH2, REF1, and REF2 data.

The display method adopted is to sweep one line while counting with the U60 memory address counter, and U56 handles display channel control.

Illuminated line length control operates using the timing and control systems formed by U64, U53, U69, U52, and U68 and counting with the blanking counter formed by U62 and U63.

X-Y display in digital mode is performed by controlling the memory address and data latch timing to the U71 and U75 D/A converters by switching with the U59 selector and the U73 and U74 data latches. In display screen blanking control, channel switching is performed by U67, phase control is performed by U69, and address noise is removed from the D/A analog data with U52. This allows a signal formed from the address clock to be mixed with the blanking signal and sent to the DSO-BL input of the trigger/sweep unit (X74-1550-00).

D/A Converter Block

The 8-bit digital signal input from the U55 display memory is converted to analog and output by the U71 and U75 D/A converters.

In NORM mode and REF display mode, the D/A converter U71 outputs the Y axis analog data, and the 12-bit X axis analog data is output from U75. The X axis data is formed by the D/A conversion of the memory address, and this data is output to the D/A converter by U73 and U74.

In X-Y mode, the U71 D/A converter is used for the Y axis (channel 1), and U75 is used for the X axis (channel 2). For the X axis (channel 2) signal, U71 is switched to function as an 8-bit D/A converter.

D/A Amplifier Block

The signals output from the U71 and U75 D/A converters are buffered by the U77 and U78 buffer amplifiers. The U77 DSO-Y signal is sent to the PRAMP unit (X73-1930-00), and the U78 DSO-X signal is sent to the TRIG/SWEEP unit (X74-1550-00).

There is also a circuit that adds the vertical hold-position DC level for CH1, CH2, REF1, and REF2 to the U77 DSO-Y signal. The DC addition is sent from the R/O board (X77-1720-00) and a DC level corresponding to each channel in the U67 display channel switch is sent to U77 trough the U80 buffer amplifier.

Analog Plotting Block

Control of the back panel analog plotting signals is handled completely in software.

Output channel control and the internal operating clock are output from the U81 microprocessor output port, and PL1 to PL4 are used as channel settings, e.g. when PL1 is low, channel 1 is output. PL2 to PL4 are used for switching in the same manner.

The named U81 port signals are defined as follows: PL-CLK is the internal operating clock, P-LIFT is pen lift, START is plot start, and PLOT is plot mode selection.

Analog plot signals are handled as follows: when the START signal goes high, the signals output from U77a and U78a are switched by the analog switch U110, and output from the back panel BNC connector through U151.

During plotting operations, the CRT scan is stopped, and the waveform is displayed as illuminated points from the START time. When the plotting operation has completed, the waveform displayed prior to plotting is redisplayed.

Microprocessor Block (X77-1730-00)

The microprocessor is driven by the X3 clock at 12.288 MHz, and controls the following memories: 32 kbytes of ROM, 8 kbytes of RAM (U90) used as a working area, 32 kbytes of buffer memory (U89), and 32 kbytes of REF memory (U105). The U92, U106, and U107 address selectors perform port enabling.

Since a battery backup is provided for the REF memory, the contents of REF memory is maintained even when the main power is off.

CIRCUIT DESCRIPTION

Clock Divider Block

The 40 MHz output of the X4 oscillator is taken as the base signal and divided to provided several different clock signals. The 40 MHz signal is divide by 2 by U131a to generate a 20 MHz clock, and this clock is divided by 2 by U131b to form a 10 MHz clock.

The 40 MHz signal is divide by 10 by U130 to form a 4 MHz clock, and this clock is divided by 2 by U132 to form a 2 MHz clock. This signal is passed though the U134 divider and then the U137 phase compensation circuit, and is then switched by U133 to form the sampling clock and the trigger clock. Also, the 20 MHz signal prior to the U133 selector is passed through the U114 EQU gate, and sent to the A/D unit (X78-1080-00) as a 20 MHZ clock. A 10 MHz clock is sent to the R/O unit (X77-1720-00) and a 4 MHz clock (a 0.25 μs period) is sent to the X78-1080-00 A/D converter for display use.

The sampling clock is selected under microprocessor U81 control at the U138 OUT port.

The sampling frequencies are shown in the table below.

EQU mode		NORM mode		ROLL mode	
Range	Frequency	Range	Frequency	Range	Frequency
20 ns	20 MHz	10 μs	20 MHz	0.5 s	400 Hz
50 ns		20 μs	10	1 s	200 Hz
0.1 μs		50 μs	4	2 s	100 Hz
0.2 μs		0.1 ms	2	5 s	40 Hz
0.5 μs		0.2 ms	1	10 s	20 Hz
1 μs		0.5 ms	400 kHz	20 s	10 Hz
2 μs		1 ms	200	50 s	4 Hz
5 μs	20 MHz	2 ms	100	100 s	2 Hz
		5 ms	40	200 s	1 Hz
		10 ms	20	500 s	0.4 Hz
		20 ms	10		
		50 ms	4		
		0.1 s	2		
		0.2 s	1		

Trigger Block

The trigger block consists of an auto-trigger circuit, an equivalent sampling circuit and a trigger counter circuit.

The auto-trigger circuit takes its inputs from the TRIG/SWEEP unit (X74-1550-00) at ECL levels.

Transistor Q120 converts ECL to TTL levels, and its output is input to the U123 and U124 auto-trigger counters. The auto-trigger counter can operate when the auto-set mode pin (U127, pin 16) is high. In digital mode NORM sampling is performed once, and the number of times the TRIG signal is input in a SWEEP-G period is counted with the U123 and U124 counters. This value is read in by the microprocessor from the U120 read port, and the range is set based on microprocessor calculations. When an error is generated on a U81 microprocessor read of the U91 read port due to the U135 error bit being set to high in response to over 256 counter events, the upper range is reset, NORM sampling is performed, and the microprocessor calculates an optimal range by reading in the counter value.

The trigger counter block consists of a pre-trigger counter circuit, a post-trigger counter circuit, and trigger synchronization circuit.

The trigger signal is generated by inputting the real-time SWEEP-G signal with U152, synchronizing that signal with the sampling clock with the U121 synchronization circuit, and outputting it as the post-trigger load pin, equivalent sampling, and TRIG-G signals.

In the pre-trigger counter block, which consists of U139 and U140, the time between the start of sampling and the point when the trigger signal is enabled is counted. The setting can be set to any integer multiple up to −80 times the sweep time per division.

In the post-trigger counter block, which consists of U141 to U143, the time between the trigger signal input and the output of the sampling end signal is counted. This time can be set to any integer multiple up to + 10,000 times the sweep time per division.

The U137 start gate is set to low by the sampling start pulse, which is generated in software, and the pre-trigger counter (U139 and U140) is counted up to the set value. The synchronization circuit is enabled by the RCO output and the TRIG-DEL gate U128, and the SWEEP-G signal is input.
When the SWEEP-G signal is input the post-trigger counter operates and the sampling end signal is output. Note that the sampling end signal generates an interrupt to the microprocessor U81.
In equivalent sampling mode, a single cycle of the real-time RTO-SWEEP signal is converted to a pulse signal by the U129 comparator and is used as a sampling clock with a period of one pulse per sweep.
The RTO-SWEEP input is impedance converted by Q162 and input to the U129 comparator. The digital value resulting from counting the SWEEP-G signal by U149 is converted to an analog value by the U148 2-bit D/A converter and sent to the U129 comparator though the U150 D/A buffer.
The comparator output pulses are output through the U155 selector as the clock signal for the counters.

R/O Interface Block

The R/O interface block is described in the section describing the R/O block. Refer to that section for details.
R/O output data is output to the R/O bus by U108, and R/O input data is input by U109.
Control interface is implemented by U91, U114, and U113.

GP-IB Interface Block

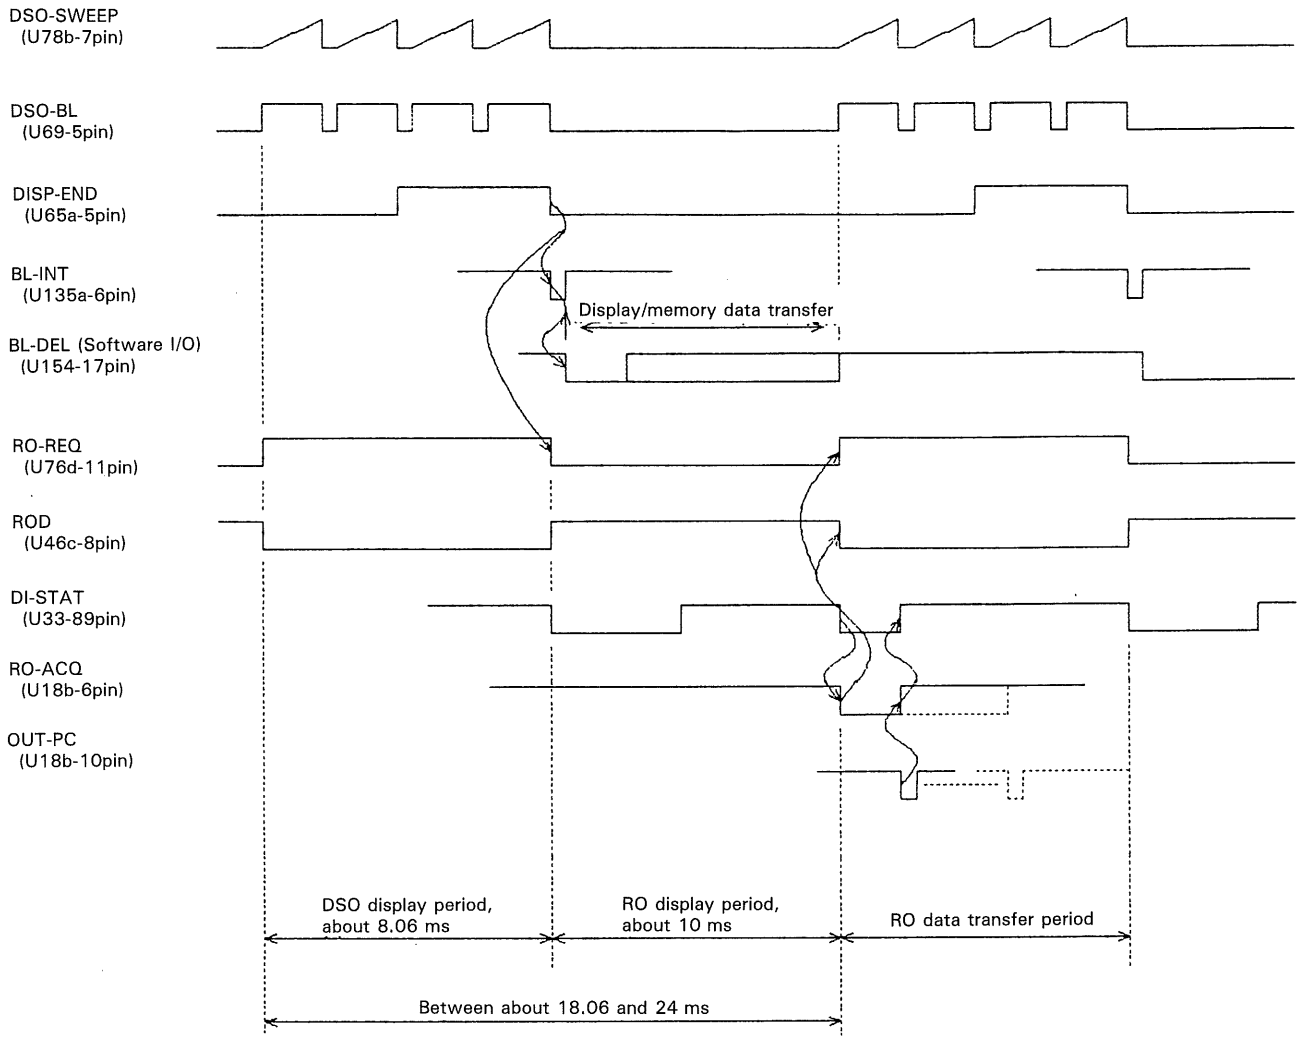
GP-IB implements an IEEE 488 standard interface using the U88 special-purpose LSI.
The GP-IB driver and receiver are implemented by U86 and U87, and the address data is read in from the switch data by the U156 input port.

RS-232C Interface

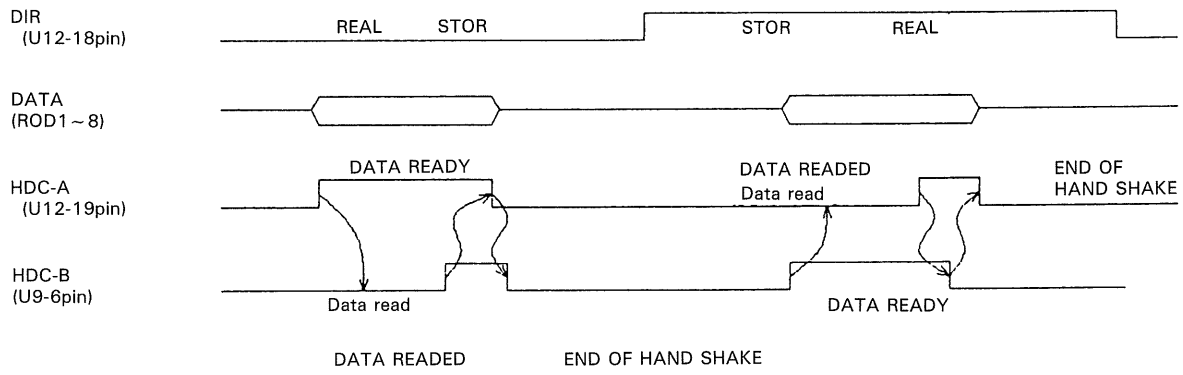
The RS-232C port is used as a dedicated digital plotter port, and is implemented by using the U81 microprocessor internal serial port through the U80 driver/receiver.
Note that the speed setting and analog/digital output switching are specified by reading in switch data through the U157 input port.

CIRCUIT DESCRIPTION

RO and DSO Dual Operating Timing Chart

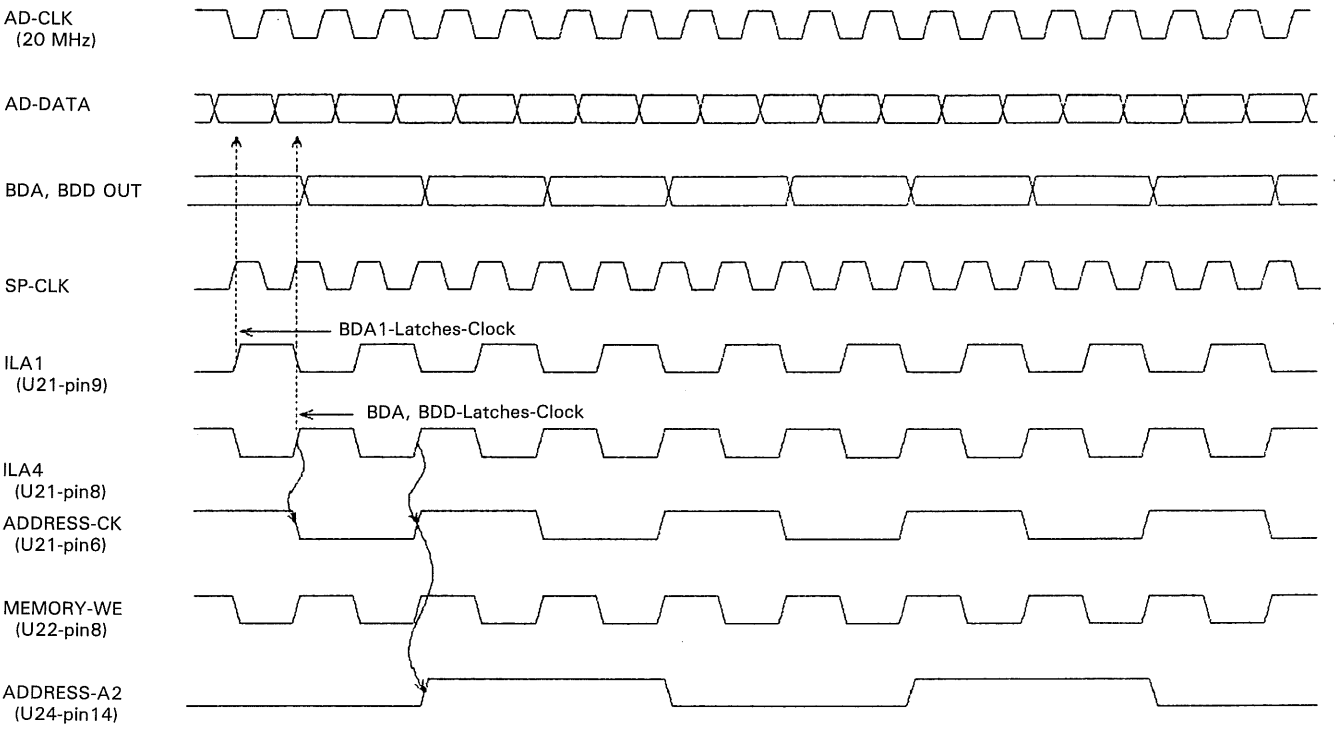


RO/STOR Communications Timing Chart



CIRCUIT DESCRIPTION

NORM Sampling Timing Chart



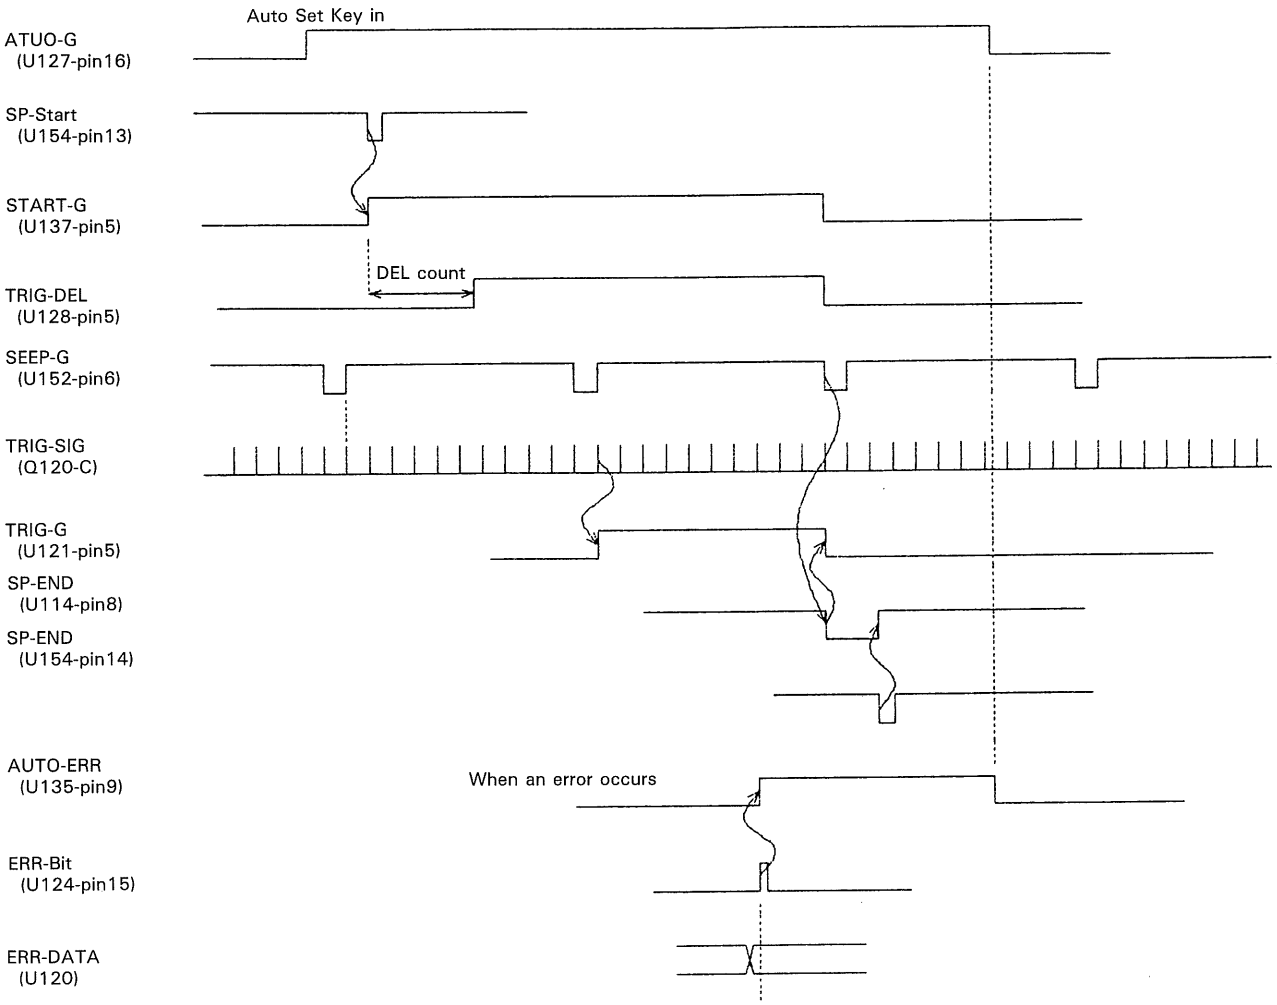
The figure above is the timing chart for the highest sampling rate (50 ns) at 10 μs/div.
Since peak operation is performed using U2 and U20, the timing must fulfill the above conditions.
Roll operation is similar.

CIRCUIT DESCRIPTION

Auto-Set Timing Chart

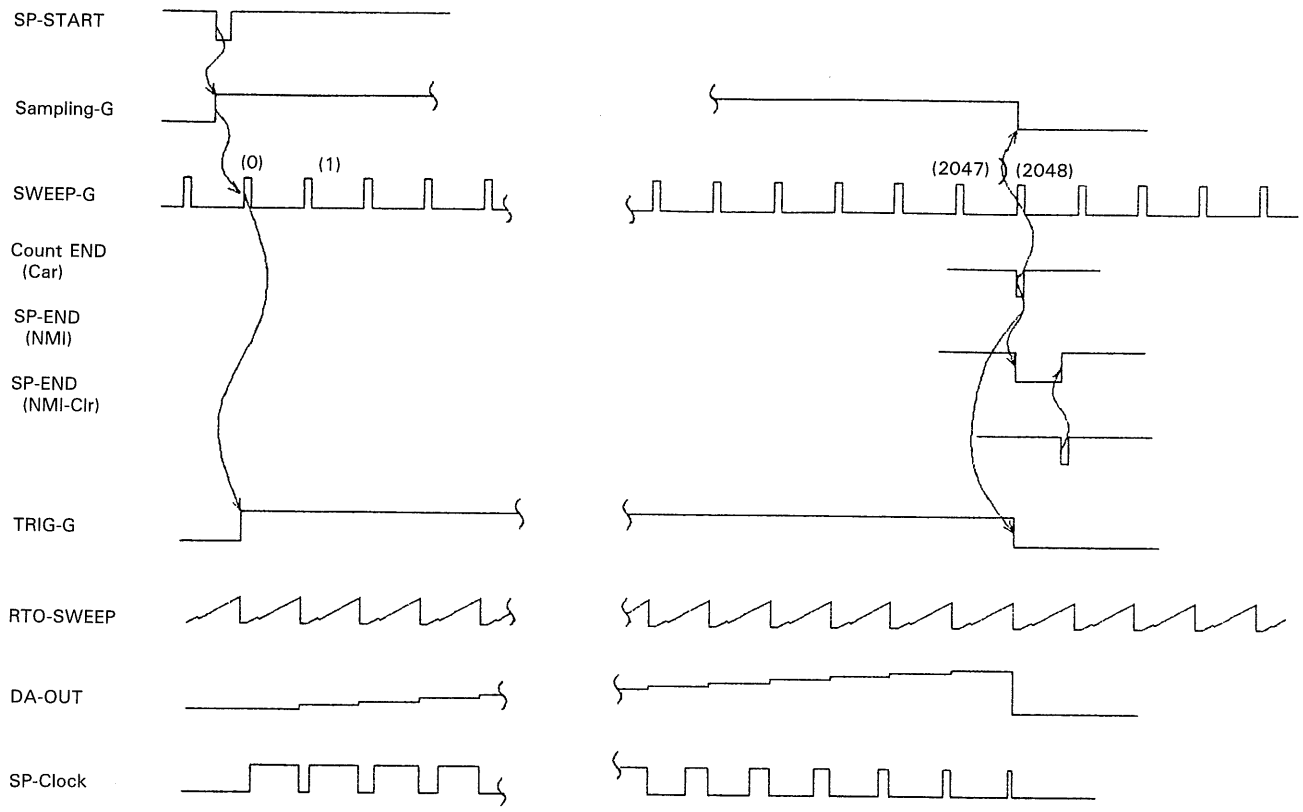
The auto-set operation for the vertical axis sets the volts/div setting in software by processing the A/D sampling data. Sampling is performed in 2-kword units.

The following is the timing chart for the horizontal axis auto-set operation.



CIRCUIT DESCRIPTION

Equivalent Sampling Timing Chart



Equivalent sampling is implemented by iterating the timing shown above.
Although the sampling time also depends on the input signal, a single sampling cycle is completed in SWEEP-G times 2048 units.

ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.
The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available, contact your dealer. For optimum adjustment, turn the power on and warm up the scope sufficiently (more than 30 minutes) before starting.
Before calibrating the scope, check the power supply voltage.

TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustment.

Test Equipment	Model	Minimum Specification
Digital Multi-Meter	DL-711 (KENWOOD)	Impedance: More than 10 MΩ, Measuring range: 0.01 V to 199 V
Sine-Wave Generator	651 B (YHP)	Frequency: 10 Hz to 10 MHz, constant voltage over tuning range
Sine-Wave Generator	SG-503 (Tektronix)	Frequency: 50 kHz to 100 MHz, Output impedance: 50 Ω, constant voltage over tuning range
Square-Wave Generator	PG-506 (Tektronix)	Output signal: 1 kHz, Amplitude: 10 mVp-p to 10 Vp-p, Accuracy: within ±1%, Rise time: 35ns or less 100 kHz, Rise time: 1 ns or less
Q Meter	4343B (YHP)	—
Color Pattern Generator	CG-911A (KENWOOD)	—
Oscilloscope	CS-6020 (KENWOOD)	Sensitivity: more than 1 mV Frequency response: More than 100 MHz
Time-Marker Generator	TG-501 (Tektronix)	Time mark: 0.5 s to 0.1μs repetive waveform
High-Voltage Probe	—	Input Impedance: 1000 MΩ
Termination	—	Impedance: 50 Ω Accuracy: within 3%
Termination	—	3 watts type impedance: 50 Ω
Attenuator	—	−20 dB attenuation (50 Ω)

Table 1

PREPARATION FOR ADJUSTMENT

Control Settings

The control settings listed below must be used for each adjustment procedure.
Exceptions to these settings will be noted as they occur. After completing a adjustment, return the controls to the following settings.

NAME OF KNOBS	POSITION
INTEN	12 o'clock
READOUT INTEN	Fully counterwise
FOCUS, ASTIG	Optimum position
CH1, CH2 ▲▼ POSITION	Mechanical center
◄ ► POSITION	Mechanical center
×10 MAG/EQU	LED OFF
VARIABLE, H.VARIABLE (VOLTS/DIV, SWEEP TIME/DIV)	CAL
AC-GND-DC (CH1 and CH2)	DC (GND at no signal)
VERTICAL MODE	CH1
HORIZONTAL MODE	AUTO
TRIGGERING COUPLING	AC
TRIGGERING SOURCE	CH1
TRIGGERING LEVEL	Mechanical center
VOLTS/DIV (CH1 and CH2)	10 mV/DIV
SWEEP TIME/DIV	1 ms/DIV
PROG SET	Press twice to set to initial setting (the indicator goes off).

Table 2

ADJUSTMENT

1. Power Supply and CRT Section Adjustments

Item	Adjustment	PCB	Procedure
−10 V	VR1	X68-1480	Adjust VR1 so that the terminal voltage at pin No. 2 of the connector P41 is −10 V.
Focus Center	VR4	X68-1480	Push the FOCUS knob in (for the FOCUS operation) and then set it to the mechanical center position. Pull the knob out (for the ASTIG operation), display a luminescent spot in the center of the screen and adjust the ASTIG control and VR4 to minimize the size of the spot.
Intensity	VR2	X68-1480	Display the luminescent spot in the center of the screen and turn the REAL-INTEN knob to a 10 o'clock position. Then adjust VR2 so that the spot is dimly visible.
CRT Center	VR2	X80-1090	With Q1-collector and Q2-collector short-circuited, adjust VR2 so that the luminescent line comes to the center of the screen.
Vertical Center Voltage	VR5	X80-1090	With Q1-collector and Q2-collector short-circuited, adjust VR5 to give 37 V at pin No. 1 of the connector P42 so that the luminescent line comes to the center of the screen.
Horizontal Center Voltage	VR9	X80-1090	In X-Y mode, adjust HORIZONTAL POSITION so that the luminescent spot comes to the center of the screen. Adjust VR9 to give 60 V at pin No. 1 of the connector P43.

2. Vertical Section Adjustments

Item	Adjustment	PCB	Procedure
CH1 100 Hz Sag	VR2	X75-1200	CH1 VOLTS/DIV: 10 mV Apply square waves using a square-wave oscillator so that the amplitude extends over 6 divisions on the screen. Adjust VR2 so that the square waves are parallel to each other.
CH2 100 Hz Sag	VR102	X75-1200	Adjust in the same way as for CH1.
CH1 1 kHz Waveform Shaping	TC903 TC904	X75-1200	AC-GND-DC: DC Apply 1 kHz square waves to CH1 INPUT with the amplitude extending over 4 to 6 divisions, then adjust in each range so that leading edges are parallel to each other. TC903 for 0.1 V/div, TC904 for 1 V/div
CH2 1 kHz Waveform Shaping	TC913 TC914	X75-1200	Adjust in the same way as for CH1.
CH1 Input Capacity	TC901 TC902	X75-1200	AC-GND-DC: DC CH1 VOLTS/DIV: 10 mV Connect a capacity meter to CH1 INPUT and measure the capacity in the 10 mV range. Adjust so that the capacities in each range are the same as for the 10 mV range. TC 901 for 0.1 V/div, TC902 for 1 V/div Input capacity: 22 pF ±3 pF
CH2 Input Capacity	TC911 TC912	X75-1200	Adjust in the same way as for CH1.
CH1 Step ATT Balance	VR1 VR1	X75-1200 X73-1930	SWEEP TIME/DIV: 1 ms AC-GND-DC: GND Adjust VR1 (X75-1200) so that the luminescent line does not vary even when the range is switched between 1 mV and 2 mV. Adjust VR1 (X75-1930) so that the luminescent line does not vary even when the range is switched between 2 mV and 5 mV.

ADJUSTMENT

Item	Adjustment	PCB	Procedure
CH1 Variable Balance	VR5	X73-1930	VOLTS/DIV: 10 mV SWEEP TIME/DIV: 1 ms Adjust VR5 so that the luminescent line does not move even when the VARIABLE knob is rotated.
CH2 Step ATT Balance	VR101 VR201	X75-1200 X73-1930	Adjust in the same way as for CH1.
CH2 Variable Balance	VR215	X73-1930	Adjust in the same way as for CH1.
CH2 INV Balance	VR216	X73-1930	CH2 POSITION: Display in the center of the screen. CH2 VOLTS/DIV: 1 mV SWEEP TIME/DIV: 1 ms Adjust VR216 so that the luminescent line does not move even when the CH2 INV switch is turned ON/OFF.
CH2 Position Center	VR205	X73-1930	AC-GND-DC: AC CH2 VOLTS/DIV: 10 mV SWEEP TIME/DIV: 1 ms CH2 INPUT: Sine wave with the amplitude extending over approx. 10 divisions on the screen Display CH2 after pressing SET, then adjust VR205 so that it comes to the center.
CH1 Position Center	VR4	X73-1930	Adjust in the same way as for CH2.
CH1 Gain	VR1	X80-1090	AC-GND-DC: DC VOLTS/DIV: 10 mV Apply a 50 mV square wave, and adjust so that the amplitude extends over 5 divisions on the screen.
CH1 1 mV Gain	VR2	X73-1930	AC-GND-DC: DC VOLTS/DIV: 1 mV Apply a 5 mV square wave, and adjust so that the amplitude extends over 5 divisions on the screen.
CH2 Gain	VR206	X73-1930	AC-GND-DC: DC VOLTS/DIV: 10 mV Apply a 50 mV square wave, and adjust so that the amplitude extends over 5 divisions on the screen.
CH2 1 mV Gain	VR202	X73-1930	AC-GND-DC: DC VOLTS/DIV: 1 mV Apply a 5 mV square wave, and adjust so that the amplitude extends over 5 divisions on the screen.
X Gain	VR324	X73-1930	AC-GND-DC: DC CH2 VOLTS/DIV: 10 mV HORIZONTAL MODE: X-Y Apply a 50 mV square wave, and adjust so that the amplitude extends over 5 divisions on the horizontal axis on the screen.

ADJUSTMENT

3. TRIG Section Adjustments

Item	Adjustment	PCB	Procedure
FIX Level Center	VR1	X74-1550	HORIZONTAL MODE : FIX, AUTO TRIGGERING SOURCE : CH1 COUPLING : DC INPUT : Sine wave with the amplitude extending over 4 divisions on the screen Adjust VR1 so that the starting point of the waveform on the screen has the same amplitude in the center of the waveform when switching SLOPE between + (plus) and − (minus).
TRIG Level Center	VR123 VR323 VR428	X73-1930	HORIZONTAL MODE : AUTO TRIGGERING SOURCE : CH1/CH2/EXT (switching) COUPLING : AC/DC (switching) INPUT : Sine wave with the amplitude extending over 4 divisions on the screen Adjust VR1 so that the starting point of the waveform on the screen does not vary when switching COUPLING between AC and DC. (Align the point for DC with that for AC.) VR123 for CH1, VR323 for CH2, VR428 for EXT

4. Horizontal Section Adjustments

Item	Adjustment	PCB	Procedure
1 ms range	VR143	X74-1550	SWEEP TIME/DIV : 1 ms CH1 INPUT : Input 1 ms Time Marker. Adjust VR143 to align the input signal with the scale on the screen.
10 ms range	VR138	X74-1550	SWEEP TIME/DIV : 10 ms CH1 INPUT : Input 10 ms Time Marker. Adjust VR138 to align the input signal with the scale on the screen.
0.2 μs range	TC128	X74-1550	SWEEP TIME/DIV : 0.2 μs CH1 INPUT : Input 0.2 μs Time Marker. Adjust TC128 to align the input signal with the scale on the screen.
1 μs range	TC127	X74-1550	SWEEP TIME/DIV : 1 μs CH1 INPUT : Input 1 μs Time Marker. Adjust TC127 to align the input signal with the scale on the screen.
× 10MAG Gain	VR8	X80-1090	SWEEP TIME/DIV : 1 ms CH1 INPUT : 10 μs Time Marker With × 10MAG KEY on (with the LED lit up), adjust VR8 to align the input signal with the scale on the screen.
× 10MAG Center	VR7	X80-1090	SWEEP TIME/DIV : 1 ms CH1 INPUT : 5 ms Time Marker With × 10MAG KEY on (with the LED lit up), align the second Time Marker on the screen with the scale in the center using Horizontal Position. With × 10MAG KEY off (with the LED unlit), adjust VR7 to align the second Time Marker with the scale in the center.
Horizontal Position Center	VR6	X80-1090	SWEEP TIME/DIV : 1 ms CH1 INPUT : 10 ms Time Marker Adjust VR6 so that the Marker on the screen displays in the same range when the Position volume is fully turned clockwise and counterclockwise (with 10 divisions for each side).
X Position Center	VR145	X74-1550	SWEEP TIME/DIV : 1 ms Using Horizontal Position, align the starting point of the luminescent line with the scale at the left end on the screen. With Horizontal Mode X-Y Key on (with the LED lit up), adjust VR145 so that the luminescent spot on the screen comes to the center of the screen.

ADJUSTMENT

5. Display System

Item	Adjustment	PCB	Procedure
Y Gain and Position	VR5 VR6	X78-1080	* Adjust using a test pattern (stepped-wave) How to output a test pattern 1. Turn the power switch off. (Power off) 2. Turn the power switch on while pressing the AUTO SET switch. (Restart) 3. Release the AUTO SET switch. * Adjust VR5 to align with each division of the Y axis scale on the screen. Move the test pattern in Y direction using VR6 so that VR5 can be adjusted easily. * Adjust VR6 to align the test pattern (stepped-wave) with the Y axis scale on the screen at intervals of 8 divisions.
X Gain and Position	VR7 VR8	X78-1080	* Adjust using a test pattern (stepped-wave) * Adjust VR7 to align with each division of the X axis scale on the screen. Move the test pattern in X direction using VR8 so that VR7 can be adjusted easily. * Adjust VR8 to align the test pattern (stepped-wave) with the X axis scale on the screen at intervals of 10 divisions.
X Position	VR8	X78-1080	Stopping the test pattern output Turn the power on again. TIME/DIV : 1 ms * Using Horizontal Position, align the starting point of the luminescent line in REAL mode with the scale at the left end on the screen. Adjust VR8 so that the luminescent line starts from the same point even when the mode is changed to STORAGE.

6. AD system

Item	Adjustment	PCB	Procedure
CH1 AD Gain and Position	VR63 VR142	X78-1080 X73-1930	VOLTS/DIV : 10 mV SWEEP TIME/DIV : 0.2 ms CH1 INPUT : 50 mV square wave TRIGGERING MODE : AUTO * In REAL mode, display in a position on the screen where adjustment can be performed easily. * Change the mode from REAL to STORAGE, then adjust VRs 63 and 142 so that the gain and the position are the same as for REAL. (Adjust precisely repeating this procedure several times.) VR142 for gain and VR63 for position adjustment.
CH2 AD Gain and Position	VR69 VR342	X78-1080 X73-1930	VOLTS/DIV : 10 mV SWEEP TIME/DIV : 0.2 ms CH1 INPUT : 50 mV square wave TRIGGERING MODE : AUTO * In REAL mode, display in a position on the screen where adjustment can be performed easily. * Change the mode from REAL to STORAGE, then adjust VRs 69 and 342 so that the gain and the position are the same as for REAL. (Adjust precisely repeating this procedure several times.) VR342 for gain and VR69 for position adjustment.

ADJUSTMENT

Item	Adjustment	PCB	Procedure
CH1 EQU Mode Gain and Position	VR601 VR602	X78-1080	VOLTS/DIV : 10 mV SWEEP TIME/DIV : 5 μs CH1 INPUT : 50 kHz sine wave with the amplitude extending over 5 divisions on the screen AC-GND-DC : AC TRIGGERING MODE : AUTO * In STORAGE NORM mode, display in a position on the screen where adjustment can be performed easily. * Switching between NORM and EQU (×10 MAG), adjust VRs 601 and 602 so that the gain and the position are the same as for REAL. (Adjust precisely repeating this procedure several times.) VR602 for gain and VR601 for position adjustment.
CH2 EQU Mode Gain and Position	VR701 VR702	X78-1080	VOLTS/DIV : 10 mV SWEEP TIME/DIV : 5 μs CH2 INPUT : 50 kHz sine wave with the amplitude extending over 5 divisions on the screen AC-GND-DC : AC TRIGGERING MODE : AUTO * In STORAGE NORM mode, display in a position on the screen where adjustment can be performed easily. * Switching between NORM and EQU (×10 MAG), adjust VRs 701 and 702 so that the gain and the position are the same as for REAL. (Adjust precisely repeating this procedure several times.) VR702 for gain and VR701 for position adjustment.
TIME/DIV Gain and Position	VR11 VR12	X77-1730	VOLTS/DIV : 10 mV SWEEP TIME/DIV : 0.1 μs CH2 INPUT : TIME Marker 0.1 μs with the amplitude extending over approx. 4 divisions on the screen AC-GND-DC : AC TRIGGERING MODE : AUTO * Display in a position on the screen where adjustment can be performed easily. * Adjust VR11 to align with each division of the X axis scale on the screen. Move in horizontal direction using Horizontal Position so that VR11 can be adjusted easily. (Perform the adjustment operation with the marker signal of F 2% for the purposes of (1) preventing the error due to temperature drift and (2) satisfying the specifications also in the 20 μs range.) * Adjust VR12 so that the waveform is displayed without any breaks. * Check to make sure that there is no break in the displayed waveform switching the range between TIME/DIV 5 μs and 20 ns.

ADJUSTMENT

7. Overshoot and CAL Adjustments

Item	Adjustment	PCB	Procedure
Overshoot	TC1 TC2 <for CH1> TC2 VR3 TC3 VR97 TC97 <for CH2> TC202 VR203 TC203 TC280	X80-1090 X73-1930	CH1, 2 VOLTS/DIV : 10 mV CH1, 2 AC-GND-DC : DC SWEEP TIME/DIV : 0.1 μs, 0.2 μs • Apply a 1 MHz square wave to CH1 INPUT. * In STORAGE EQU mode, adjust TC2, TC3 and VR3 so that both overshoot and ringing extend over 0.3 divisions. * In REAL mode, adjust TC1 and TC2 so that the waveform is flat in the intermediate-frequency band. * In REAL mode, adjust TC97 and VR97 so that both overshoot and ringing extend over 0.3 divisions. • Apply a 1 MHz square wave to CH2 INPUT. * In STORAGE EQU mode, adjust TC202, TC203 and VR203 so that both overshoot and ringing extend over 0.3 divisions. * In REAL mode, adjust TC280 so that the waveform is flat in the high-frequency band. (At this point of time, both overshoot and ringing should extend over 0.3 divisions.) Confirmation after adjustments The frequency characteristics in the 10 mV range should be 55 MHz (−3 dB) or more for each channel. The channel signal difference (between CH1 and CH2 INV ADD) should be 0.5 divisions or less (when applying a 50 MHz square wave with the amplitude extending over 8 divisions).
CAL	VR5 VR6	X68-1480	Connect an oscilloscope calibrated for 100 MHz band to the CAL terminal and set VOLTS/DIV to 0.2 V and TIME/DIV to 0.1 ms. Adjust VR5 so that one cycle is 1 ms (i.e. 10 divisions). Adjust VR6 so that the amplitude is 1 V (i.e. 5 divisions).

8. Cursor Section Adjustments

Item	Adjustment	PCB	Procedure
Cursor Y Gain	VR3	X80-1090	CURSORS : ΔY1 Δ : Turn clockwise until the cursor stops at the top of the screen. ΔREF : Turn counterclockwise until the cursor stops at the bottom of the screen. CH1 VOLTS/DIV : 10 mV * Adjust VR3 so that the interval between the cursors is 8 divisions. Move the cursor in Y direction using VR4 so that VR3 can be adjusted easily.
Cursor Y Position	VR4	X80-1090	CURSORS : ΔV1 Δ : Turn clockwise until the cursor stops at the top of the screen. ΔREF : Turn counterclockwise until the cursor stops at the bottom of the screen. * Adjust VR4 to align two horizontal cursors with the uppermost and lowest scales on the screen respectively.
Cursor X Gain and Position	VR10 VR11	X80-1090	CURSORS : ΔV1 Δ : Turn clockwise until the cursor stops at the right end of the screen. ΔREF : Turn counterclockwise until the cursor stops at the left end of the screen. * Adjust VR11 so that the interval between the cursors is 10 divisions. Move the cursor in X direction using VR10 so that VR10 can be adjusted easily. * Adjust VR10 to align two vertical cursors with the right end and left end scales on the screen respectively.

ADJUSTMENT

9. PLOT system

Item	Adjustment	PCB	Procedure
X Gain	VR14	X78-1080	AC-GND-DC : GND SWEEP TIME/DIV : 10 μs * In NORM mode, turn CH1 POSITION fully clockwise. Then change the mode to HOLD mode, press the PLOT KEY and adjust VR14 to give +5 V at terminal X of PEN OUT in the rear side.
Y Gain	VR16	X78-1080	AC-GND-DC : GND SWEEP TIME/DIV : 10 μs * In NORM mode, turn CH2 POSITION fully clockwise. Then change the mode to HOLD. X-Y mode, press the PLOT KEY and adjust VR16 to give +5 V at terminal Y of PEN OUT in the rear side.
